
such training can be had; such knowledge can only be gained by actual experience on the ground.

Q. Now, in this exhibit which you have introduced, you say you have studied several lines. As shown on the first sheet, the lines included in the study are: Second B, KB 16-inch, K-5, K-5-1, 0-29, and L-26.

[fol. 3226] A. That is correct.

Q. Now, all the data on those lines that you had for the purpose of your study, you say were gained from actual construction records?

A. That is correct—from the Daily Progress Reports which were filed each day by the men in charge on the ground; for instance, by the time-keeper, who was responsible for the time; by the engineer, who was responsible for the performance.

Q. Now, explain to the jury, Mr. Steinberger, just how you got these actual cost records?

* * * * * * *

A. Well, we can take any job—the first one, here we have Line K-5, 6-inch, which is a line running from north of Granbury—to be exact, the line running due north of Granbury, connecting with Line K coming from West Texas, going south as far as Valley Mills; Line K-5-1 branches off south of Walnut Springs, going southwest to Hamlin. On the construction of that particular line we had—we used [fol. 3227] these Daily Progress Reports. Those reports are segregated into two sections; one is called the first section, or the firing line section, and the second is called the second or laying section. On the firing line or first section is shown the time—so-called the general time by the general foreman who has supervision of the entire job, and the assistant foreman, and the time-keeper, who takes care of the time for the front line gang, which is the firing line. And the trucks and cars assigned to general operation and general supervision of that particular job. The next is for cutting—for cutting and removing brush and timber, cutting the right of way, and building the fences and building temporary gates for this particular job. That work was done several weeks prior to the beginning of the laying of the line. The same is true with stringing of pipe. Those reports in that case were furnished me separately from the Stores Department, which Department is in charge of

stringing the pipe—that is, unloading the pipe from the railroad cars and hauling it along the right of way. And then comes the lining up. Lining up is welding the pipe end to end and tack welding. That time goes, for instance, to a foreman or a number of foreman. On that particular [fol. 3228] job we had two foreman, at 40 cents per hour, or $8.00 per day; 17 laborers at 35 cents per hour, 170 hours, or $59.50 per day; a truck driver at 40 cents per hour, 11 hours, $4.40; one truck, 11 hours, $8.40; and a blacksmith at 50 cents per hour for ten hours, would be $5.00. Then comes the welding; for the welding we had a foreman—that is one foreman, $210.00 per month, or $6.77 per day; line welders, $1.00 per hour, worked 125 hours, total cost $125.00; generator men, three, at 40 cents per hour, working 25 hours, at $10.00—a total per day of $10.00; four laborers at 35 cents per hour, working 43 hours, or a total of $15.05; one truck driver, $125.00 per month, or $4.03 per day. One truck, 10 hours, at a dollar per hour, or $10.00 per day; five teams with drivers, at 70 cents per hours, 50 hours a day, or a total of $35.00; and a night watchman at 35 cents per hour, 13 hours, or a total of $4.55. Now, that crew used 15 drums of oxygen, 1,000 pounds of carbide, and 225 pounds of welding rods. During that day, on this particular day it is noted on the sheet that they lost two hours—the entire crew lost two hours, on account of detouring; but the Company had to pay the time regardless of whether the men were doing any welding or not; they [fol. 3229] made 160 six-inch welds that day; previous to that they had made—or, rather, that makes a total of 2658 welds. For that day next comes the testing of the line—that is, testing the various sections laid on top of the ground, and as you will recall Mr. Biddison's testimony, there are generally six or seven sections welded together on the side of the ditch, and then they are bull-plugged—or one end is bull-plugged and the other end is put on the compressor and pumped up to the required test of 250 to 300 pounds. For that we had: 1 foreman at $4.00 per day; one laborer, $3.50; one air compressor mounted on a truck, working five hours at a dollar per hour, or $5.00 for that day. That crew tested 182 joints which were welded for that particular day. Next came the painting of the pipe on the side of the ditch. We had one paint foreman, at $125.00 per month, or $4.03 per day; five laborers at 35

cents per hour, or $17.50 per day; one team, with driver, at 70 cents per hour, or $7.00 per day.

Q. Now, wait just a minute before you leave that.

A. All right.

Q. Now, just to sum this up, Mr. Steinberger,—at the top of your sheet you have: "Daily Progress Report on Construction of Line ....". In this particular case it is [fol. 3230] filled in with "K-5, six-inch, near Granbury".

A. That is correct.

Q. The date on this particular date line is 8/8/29?

A. That is correct.

Q. Then ER, that stands for expenditure requisition.

A. That is correct. Each job is assigned a separate number.

Q. In this case it is 6945. And then you have a place for the weather.

A. That is correct.

Q. Showing whether it is fair or stormy or rainy?

A. That is right.

Q. Then, going down the sheet, you have all the time and expenses divided up in the divisions you have just explained to the jury?

A. That is correct.

Q. And you have, in the case of welding, places where the materials are used, the amounts of material, and any notations as to loss of time, and that sort of thing?

A. That is correct.

Q. Now, you have got that same sort of sheet on all those lines, haven't you?

A. That is correct.

Q. Who filled out this sheet?

[fol. 3231] A. Those sheets were filled out by the timekeeper for the engineer on the job, and signed by the foreman.

Q. And then those sheets were sent in by the foreman to you at your Dallas office, and you compiled the information that you have given in these Progress Reports, is that it?

A. That is correct; but you understand, Mr. Fitzhugh, that those Progress Reports were designed by myself.

Q. Don't put that book up for just a minute. I want you to show the jury some more information.

A. Pardon me.

Q. Now, on the building of lines, the actual construction you usually have a rear end gang and a front end gang, do you not?

A. That is right.

Q. What do you mean by those designations?

A. The front end gang, as I testified before, constitutes the lining up, the welding, the testing, and the painting gangs; they are sometimes two or three miles ahead of the rear end gang, which consists of the gang clearing the right of way for the ditching machine, the hand ditching and machine gang—the ditching and machine gang, the laying gang, the backfilling gang, and finally the clean-up gang, [fol. 3232] which rebuilds the fences and takes down the temporary gates, and refixes the fences permanently.

Q. Now, the line you were just talking about was K-5, was it not?

A. K-5, six-inch, yes.

Q. Is that one of the lines in your study in this exhibit?

A. Yes, sir.

Q. Now, will you take your equipment requisition sheets or your Daily Progress Reports on Line K-5 back up to the jury rail here—will you do that, Mr. Steinberger?

A. Yes, sir.

Q. Now, before the Railroad Commission, in making the same sort of examination, we asked you to pick out at random any of the sheets on Line K-5, and I believe you referred to August 27th, because we have got the record on that same sheet. I will ask you to look at that one—that is sheet one, from stake 332-plus-00—is that right?

A. Pardon me, Mr. Fitzhugh, what performance are you speaking about?

Q. Well, what do you show for August 27th on Line K-5 in your Daily Progress Report?

A. I have here the front end gang. Will you give me those stake numbers again? I may be able to identify that. Is this the ditching gang?

[fol. 3233] Q. Yes, this is the ditching gang?

A. August 27th.

Q. Correct.

A. What is the stake number?

(Counsel hands data to witness.)

A. That is October 24th, 532——

Q. Well, I don't suppose it makes any difference; just

take any of your sheets there. This line has considerable rock on it, does it not?

A. Yes, there is considerable rock between Granbury and Walnut Springs.

[fol. 3234] Q. Well, take out some of the sheets that apply to that section of the line; will you do that?

A. I have before me October 1, 1929. That section is between Walnut Springs and Valley Mills. I have here: Hand Ditching gang, 2 foremen, 50 cents an hour, $10.00 per day; 24 laborers, 243 hours, $85.05 a day; powder men, one at 45 cents an hour, 12 hours, $5.40; truck-driver, one, at 40 cents an hour, 11 hours, $4.40; one truck, 11 hours, $8.25. That covers crumming the ditch and clearing the rock for 5,000 yards, using 150 pounds dynamite, and 250 caps, and no fuses, as those caps were electric caps.

Q. How much rock excavation did you have?

A. There was no rock excavation.

Q. So that all of the rock excavation that was actually encountered in this portion of the line was charged to crumming?

A. For the reason that it was machine excavation.

Q. What is crumming?

A. Clearing the dirt out of the ditch and making a smooth ditch.

Q. That was October 1st?

A. Yes.

Q. Can you tell how deep the rock was found in looking at the sheet?

[fol. 3235] A. No, sir.

Q. Turn back to August 27th—do you find that sheet?

A. No, sir; I don't find that sheet.

Q. Can you find this stake number?

A. That is the one I referred to—October 1st.

Q. You didn't show the hand excavation, did you?

A. No, sir; it was all crumming. October 7th, the same location, we had 100 feet of hand-ditching for Highway 67 at Stake 2410 plus 47, and at 30-foot bore, 40 foot casing.

Q. Now, Mr. Steinberger, the record before the Railroad Commission reads as follows: "August 27th, from Stake 332 plus 0-0, to Stake 566 plus 0-0, a total distance of 3400 feet, the hand excavation shows 1700 feet of rock; machine excavation from Stake 412- plus 0-0 to Stake 454 plus 0-0, a distance 1200 feet, less 200 feet skip, or a net perform-

ance of 4,000 feet same day. Trench area 16x30, soil fair, some rock." Can you find from that description the sheet I am talking about?

A. There is apparently an error in the date. I beg your pardon, I was on Line K-5.

Q. Do you have the sheet now?

A. Yes.

Q. I want this sheet because I know what you testified on that before. Do you have that now?

[fol. 3236] A. Yes.

Q. You show hand excavation of 1700 feet of rock; is that right?

A. 1700 feet of rock, yes, sir.

Q. What cubic yardage of rock was there in that amount of rock excavation?

A. I did not compute it for each individual day, but for the job overall. The individual sheet does not show it, but the detail work sheets show.

Q. How did you get the detail work sheets? Didn't you compute it from those?

A. The trench area is 16 by 30, as shown on the daily progress reports. The trench area of 16 by 30 times 1700 feet gives the yardage of excavation.

Q. What did you charge all of the labor on this 1700 feet of rock hand excavation to?

A. I charged it to rock excavation.

Q. Now, Mr. Steinberger, I wish you would look to refresh your memory and see if you did not testify before the Railroad Commission, and this question was asked: "How deep was the rock that was being excavated here?" and the answer was: "He didn't state how deep the rock was."

A. Yes.

Q. "He didn't state how deep the rock was. Where there is no cubical quantities of rock shown it is always charged to crumming. Apparently some rock along the line is shown under ditching machine." That is what you testified?

[fol. 3237] A. That may be an error, because I have before me the report and when there is no area shown of rock excavation, we took the standard trench area as shown by the ditching machine, which was 16 by 30. We probably were in error and did not charge enough to rock, for the reason that the trench in rock excavation is sometimes

slightly deeper than the standard trench, in order to give four or five inches for bedding on top of the rock.

Q. You had a whole gang working on the job, didn't you? This gang was doing all sorts of work. How did you divide up the labor hours shown for that particular gang for the different sorts of work done?

A. Mr. Fitzhugh, that had to be checked between the stake numbers. If the ditching machine showed a skip it was considered all hand excavation. We had to arbitrarily assume in some cases that some men were doing additional crumming, as all those men were not required to do all of the work with the ditching machine proper.

Q. On this day you had 200 feet of skip?

A. A 200 foot skip on ditching machine; but the ditching machine was at 412 plus 0-0 to 454 plus 0-0, or approximately two miles behind the ditching gang, which I believe it was testified did rock excavation on that date.

Q. What was the next that you had for this particular day on excavation?

[fol. 3238] A. Hand ditching: one foreman, 10 hours, $5.81; two sub-foremen, 40 cents per hour, $8.00; 530 labor hours, at 35 cents, $185.50; powder men, one, 12 hours, at $4.20; one truck driver, 13 hours, $3.85; one truck, Company No. 1103, $13.50; that gang worked from Stake 332 plus 0-0 to Stake 266 plus 0-0. They were working backwards on the line. A total of 3400 feet. Of that, 1700 feet was solid rock. They used 555 pounds of dynamite, 575 caps, and 1307 feet of fuses. Clearing for the ditching machine, one foreman, 10 hours, $4.00; 13 laborers, 130 hours, $45.50; one powder man, 11 hours, $3.85; one truck, 10 hours, Company 1094, $12.50; 3 teams with driver, 30 hours, $21.00; one Company car, Ford pick-up, No. 1210, $7.50. That crew worked from Stake 456 plus 0-0 to Stake 500 plus 0-0, or a distance of 3400 feet, using 100 pounds of dynamite, 100 caps, and 200 feet of fuses, and two air compressors, 33 hours; 3 ditching machines, 3 operators, $17.90; 3 oilers, $15.00; 2 stake-setters, $8.00; one night watchman, 13 hours, $4.55. Excavated from Stake 412 plus 0-0 to Stake 454 plus 0-0, a distance of 4200 feet, with 200 feet skip. The ditching machines used 65 gallons of gas, 2½ gallons of oil, and 5 pounds of grease. The ditch was 16 by 30, the soil was fair, some rock. Next, came the laying gang, 2 foreman at $180 per month,——

Q. That has nothing to do with excavation?

A. No.

[fol. 3239] Q. Now, show where on this sheet you show a separation of the laborers' time for machine excavation, hand excavation, and rock excavation?

A. That was testified to.

Q. You don't show it, do you?

A. I said it was all rock excavation, that particular day.

Q. Don't you have some machine excavation here?

A. Yes; but there was no hand ditching connected with it, because the next day the crumming gang came along.

Q. You don't have a bit of hand excavation?

A. No, sir.

Q. You have nothing but machine and rock excavation on this sheet?

A. That is correct.

Q. Now, then, how did you divide the laborers' time as between machine excavation and rock excavation?

A. Machine excavation?

Q. Yes, sir.

A. The machine excavation was shown under the crumming. Ordinarily, under ditching machine there is no labor; the crumming takes care of that.

Q. Where is your division of laborers' time for machine excavation, rock excavation, and hand excavation?

A. There is no division on this sheet.

Q. Take the next sheet. What is that, August 28th?

A. August 28, yes, sir.

[fol. 3240] Q. What are the kinds of excavation shown on that sheet?

A. Crumming—we will assume that crumming, as it was along there, was shown for either hand excavation or rock excavation. Under ditching machine work, from Stake 454 plus 00 to Stake 494 plus 00, a total of 4,000 feet, with a 500 feet skip, or days performance of 3500 feet, the trench was 16 by 30, except from stake 454 plus 00 to Stake 464 plus 00 it was 16 to 30 inches dirt; from Station 464 plus 00 to Station 465 plus 00, there was six inches of rock; from Station 465 plus 00 to Station 474 plus 00, there was 30 inches of dirt; from Station 474 plus 00 to Station 478 plus 00, six inches of rock; and from Station 478 plus 00 to Station 482 plus 00, thirty inches of dirt. In other words we took the overall trench, and took the distance between

the earth and the rock, and computed that, and threw it into the hand rock excavation, and considered it as rock excavation costs.

Q. On this sheet you have all three kinds of excavation —hand earth, rock, and machine?

A. No, sir. I have testified only to rock and dirt under machine. The ditching machine excavated all of the earth, whereas the rock was excavated by the hand gang.

Q. How did you split the laborers' time for machine excavation and for rock excavation on this page?

A. There were no laborers assigned to the ditching machine.

Q. Can you tell what the laborers' time is for machine excavation?

[fol. 3241] A. There was no laborers' time, other than the operators, oilers, and stake-setters.

Q. Can you tell the time for the machine excavation?

A. Three operators, 30 hours, two at $6.45, and one at $5.00 per day; 3 oilers, at 30 cents an hour, $15.00; two stake-setters, at 20 cents an hour, $8.00; one night watchman, $4.55; and two machinists, 23 hours, $40.25.

Q. Now, there was 3500 feet of performance for the machine that day?

A. Yes, sir.

Q. It shows right here (indicating)?

A. Yes, sir.

Q. Wasn't there any crumming behind the machine?

A. Apparently not. Whatever crumming there was, was included with rock excavation.

Q. There was some crumming, though?

A. Yes, sir.

Q. But whatever crumming there was you put in rock excavation?

A. That is correct; whereas on other days it may have been offset by slight rock excavation, which was charged to crumming. It is impossible to get it down to the minutest detail.

[fol. 3242] Q. Isn't crumming ordinarily a cost to be included in machine excavation?

A. That is correct.

Q. So that to the extent you have left crumming out in the rock excavation you have understated the performance actually done by the rock excavation gang?

A. That is correct. One day it may be understood on performance and other days overstated, but I have taken the final result——

* * * * * * *

Q. To that extent you have overstated the number of hours time to excavate on rock?

A. It may be true for a particular day.

Q. That is what I am talking about, and to the extent that you have failed to include crumming in your machine excavation you have overstated the performance for that particular kind of excavation?

A. That may be so, and on the following day it would be offset.

Q. Now you are trying to say that averaging it day after day it works out even?

A. Yes; so long as you account for the total money and shows your unit cost all the way through, you are correct.

[fol. 3243] Q. Well, isn't it a fact, Mr. Steinberger, that as long as you leave out crumming from machine excavation and put it into either hand earth or rock excavation that you could not possibly work out the hours for machine excavation accurately or the performance over all?

A. I may not be able to work it out accurately for a particular day, but for the job over all I think it is as accurate as it could possibly be worked out.

Q. Well, if you do that day after day won't it come out inaccurately on the job over all?

A. No, it is offset. Maybe one day it is charged to crumming and other days it is charged to rock, just short stretches, and it will offset itself.

Q. But you did leave out crumming day after day on those performance sheets?

A. No, sir, I didn't. I will be glad to read to you in the record a great many on the job.

Q. Well, pick out where you have got any crumming—show on this sheet where you have got any crumming in your machine excavation.

A. Those are the recap. sheets on the daily progress reports.

Q. You mean you worked this out from the daily progress reports?

A. Yes, sir.

Q. Those are all computations?

A. Yes, sir.

[fol. 3244] Q. Go ahead.

A. I have a day here, October 29th, we have 671 Labor hours, working from Stake 386-00 to 476-00, a distance of 9,000 feet, charged to crumming, crumming ditch and removing rock.

Q. Well, that is part of your hand excavation cost?

A. No, it is not.

Q. Well, what have you figured that in?

A. It is charged to crumming.

Q. Well, what did you charge your crumming in—as part of the machine excavation?

A. Yes, crumming is a part of machine excavation, just like clearing off a ditch is a part of it.

Q. Well, show on the sheet where that ever became a part of the machine excavation hours.

A. Our construction of Line K-5, E. R. 6943, the total cost for clearing the ditch, machine was $6,033.47; machine operation, including oiler, stake setter and operator, $5,249.92; crumming, $1,564.80, or a total cost of $12,848.19. The total excavation was 34,867.4 cubic yards, resulting in a direct cost for the ditching machine operation, exclusive of machine depreciation and amortization cost, of 36.85 cents per cubic yard.

Q. Now, that is for August 29th, rather than October 29th?—you said October.

A. Pardon me.

[fol. 3245] Q. It should be August 29th?

A. That is correct.

Q. Now, before the Railroad Commission, in testifying on this same sheet, you said: "August 29th: hand excavation from stake 386 plus 00 to stake 476 plus 00, a total distance of 9,000 feet"?

A. That is correct.

Q. "Ditching machine excavation from stake 494 to stake 542, a total distance of 4800 feet"?

A. That is correct.

Q. "And a 100 foot pick-up and a 900 foot skip"?

A. That is reversed. It is a 100 foot skip and 800 foot pick-up.

Q. "Or a net performance for that day of 3900 feet"—your total performance; that is right?

A. That is correct.

Q. "Now, the trench was rock from stake 494 to stake 459. Apparently there was some loose rock along that line and it did not give any dimension or depth of the rock." Where you said "it" you meant the requisition sheet to show the dimension of the rock?

A. Yes.

Q. "The rest of the trench was all dirt. The explanation under hand ditching is 'crumming ditch and removing rock.' Question: Now, how many hours on that day were [fol. 3246] charged to crumming? Answer: 671 hours charged to crumming"?

A. That is correct.

Q. Now, on this day these 671 hours are actually charged to crumming in the ditching—in the machine excavation; is that your testimony?

A. Yes, charged to crumming. There was some rock in connection with that, and that would offset the previous day, when it was rock and nothing charged to crumming.

Q. Now, how many men would that be?

A. Sixty-one laborers.

Q. Now, then, this crumming is simply scraping a ditch?

A. Clearing out any surplus which the machine did not take out of the ditch.

Q. Now, on this day there were sixty-one laborers engaged in cleaning up the ditch?

A. Yes, 9,000 feet—approximately two miles.

Q. On all the other days on this line you don't show any crumming hours as part of the machine excavation, do you?

A. The following day I show 588 hours, which is October 30th—I mean August 30th.

Q. How many machines did you have?

A. The same three machines.

Q. How many men on each machine crumming?

A. They are not charged to the machine; they are not charged to each machine. It is a gang to itself.

[fol. 3247] Q. Well, you have a gang behind each machine, don't you?

A. It may not be in that case. I don't remember, Mr. Fitzhugh, whether it was or not. There may be a crumming gang behind on each ditch. There were 58 men on that day and they may have been split up in three gangs working behind the machines.

Q. Wasn't the laborers' time charged in as part of the machine cost?

A. Yes, that is part of the machine cost.

Q. Find on your sheets some day where you had both hand earth and rock excavation.

A. There is no hand excavation on Line K-5. It was either all rock or the remainder was all dug by the ditching machine, except the few cases I read into the record where there were ditches for highway crossings.

Q. Mr. Steinberger, I don't understand exactly what is taking place. Here are your daily performance sheets sent to you by the foremen in the field. I asked you for data shown in the sheets. Why do you have to look into some other sheets?

A. Mr. Fitzhugh, I look in the recapitulation sheets to save time going through the daily progress reports; I wanted to see whether there was any hand earth excavation on that particular job; that is the reason I refer to my work sheets for the compilation of hand earth.

Q. Where is this line?

[fol. 3248] A. It branches from Line K 18-inch approximately 3.4 miles north of Granbury, Texas, goes to Walnut Springs, with a branch that goes to Meridian, Morgan and Clifton and ends at Valley Mills.

Q. Isn't that notoriously rough country?

A. It is rocky country between Granbury and almost to Meridian.

Q. Can you explain to the jury how you could build through such rough country as that without any hand earth excavation?

A. Yes. From the connection at Line K 18-inch to a few miles north of Glenrose it is mostly bottom land and very ideal for machine work, and from there immediately it gets into rough country, and that accounts for a considerable amount of rock excavation and crumming.

Q. Isn't it a fact that there was a good deal of hand excavation, but you have not so classified it?

A. It was not so shown on the daily progress reports.

Q. Well, I am asking you isn't it a fact that you have not classified it as such and that you show no hand excavation on these lines?

A. There was no hand excavation, other than approaches to highway crossings.

Q. Now, Mr. Steinberger, besides studying the six lines that you have shown on the first sheet in your exhibit, you studied a whole lot more lines?

A. I testified yesterday, Mr. Fitzhugh, I studied approximately 452 miles of machine excavation.

[fol. 3249] Q. That is all sizes of pipe?

A. Yes, sir, ranging from three inch outside diameter to 20 inch outside diameter.

Q. Now, you have shown in your exhibit here K-5 and K-5-1. Why didn't you show also K-5-2, which you likewise studied?—Do you have to look up your reasons for that, Mr. Steinberger?

A. K-5-2 is a very short branch line. As I testified yesterday, Mr. Fitzhugh, I took the six major lines constructed; I did not take any lines which were merely extensions of existing lines.

Q. You left this out because it was so short?

A. Yes. I didn't bother with it. There were six major lines studied, and in addition I left out several lines in Oklahoma because they were not listed in Plaintiffs' Exhibit 6.

Q. If you left this out because it was short, why didn't you put in Line "E", which contains about 190 miles?

A. I didn't make any study of Line "E", Mr. Fitzhugh. I never testified that I made such a study.

Q. Didn't you testify before the Railroad Commission, Mr. Steinberger, that you studied a portion of Line "E" that was built in about 1929?

A. That is correct; a portion of Line "E", Mr. Fitzhugh, and which portion is merely an extension of the existing line.

Q. Well, what has that to do with it?—it was a sizable [fol. 3250] piece of construction work, was it not?—what difference does it make whether it is a new line or an extension?—it still costs money to excavate.

A. Yes. The actual cost of excavation on that line was $39,032.00; it was less than $100,000.00. Let me correct that statement. It was $7,888.65.

Q. Now, what about Line K-C—why did you leave it out?

A. Line K-C?—it was merely an extension.

Q. It was a sizable extension, was it not?

A. Twenty-six thousand feet.

Q. You left out Line E-10-5, did you not?

A. Yes, sir. That is 29,000 feet.

Q. And you left out A-1-4, did you not?

A. Yes, sir. I testified on yesterday that that line is in Oklahoma, running from Frederick to Mountain Park.

Q. Well, you wouldn't object to using a line in Oklahoma for the purpose of finding unit costs?

A. That was not evaluated in Plaintiffs' Exhibit 6.

Q. Well, that has nothing to do with finding construction costs, whether in Oklahoma or Illinois or anywhere else?

A. Well, it was not evaluated in Plaintiffs' Exhibit 6. I had no basis as to the estimate used.

[fol. 3251] Q. Why did you leave out Line O-16? That is in Texas, isn't it?

A. Yes. It is a very short line.

Q. How short?

A. It's the line from Commerce to Cooper—possibly four miles.

* * * * * * *

Q. Where is Line 110 located?

A. Line 110 is a line in the West Texas area.

Q. Why did you leave it out?

A. The work that was done on Line 110 was simply an extention to the existing 110.

Q. Why did you leave out Line 18-A?

A. Line 18-A is just another extension going from the Alvord compressing station to the Alvord field.

Q. Why did you leave out Line H-3-2?

A. Because it is a line in Oklahoma.

Q. Why did you leave out Line KCE?

A. That is merely a gathering line.

Q. Where is it?

A. In the West Texas field.

Q. Well, that was evaluated in Plaintiff's Exhibit 6, wasn't it?

A. It was, but it was a very short line.

Q. And there was excavation work on it?

A. Yes.

Q. Why did you leave out Line OLB?

A. That is a gathering line in the Brad field, from the [fol. 3252] Brad compressing station into the Brad field. It is in the West Texas area.

Q. That is in Texas, isn't it?

A. Yes.

Q. Why did you leave out Line Second KC?

A. That is a gathering line, going from the compressing station at Pueblo and is merely an extension and was built after the acquisition of the Pueblo plant by Lone Star Gas Company.

Q. The amount of excavation done on this portion of Line Second KC that you studied was greater than any of the lines included in your exhibit, wasn't it, with the possible exception of Second B and probably K-5?

A. The total yardage of evacuation on Line Second KC was 17,455.5 yards, as against Second B of 151,515.8 yards.

Q. At least there's more cubic yards on Second KC than on Line L-26, which you included in your exhibit?

A. That is correct.

Q. Why did you leave out Line AK?

A. It is a gathering line and not a main transmission line.

Q. It is in Texas, is it not?

A. Yes; it is in the Panhandle field.

Q. And it is evaluated in Plaintiffs' Exhibit 6, is it not?

A. Yes.

Q. Why did you leave out E-22?

A. That is a short tap line. I do not recall why it was eliminated but it was 39,000 feet in length.

[fol. 3253] Q. Why did you leave out Line OL?

A. Line OL is a gathering line in the Brad field.

Q. It is in Texas, is it not?

A. Yes, it is.

Q. And it is evaluated in Plaintiffs' Exhibit 6?

A. Yes, and if you are desirous of having me do so, Mr. Fitzhugh, I will be glad to prepare an exhibit and include all those lines that you mentioned.

Q. Now, Mr. Steinberger, where you show on this first sheet, a column entitled book cost, you don't mean to say that those figures are to be found as a part of the accounting records of the company, do you?

A. What sheet do you refer to?

Q. Page 1 of your exhibit. The same page that we have been talking about all the time.

A. That amount is included in the figure recorded on the company books, yes.

Q. Now, answer my question.

A. Read the question, please.

(Thereupon the following question was read to the witness: "Now, Mr. Steinberger, where you show on this first sheet a column entitled Book cost, you don't mean to say that those figures are to be found as a part of the accounting records of the company, do you?")

A. I answered the question.

Q. You don't mean to say that on Line Second B, for example, you would find a book cost as appearing on the [fol. 3254] books of the company, in the amount of $156,650.41?

A. The books of the company show the amount of $449,288.15 for construction cost. Analyzing that cost, based upon the daily progress reports, this amount of $156,650.41 for excavation is found.

Q. Well, this figure of $156,650.41 that you have put in this exhibit as being book cost is not shown on the books of the company, but is a computed figure, as computed by yourself, is it not?

A. Based upon the daily progress reports, yes, in order to get an exact segregation of the various classifications of work.

Q. Are you familiar with the way the book costs for Line Second B appear on the books of the company?

A. Very familiar, yes.

Q. Do you have a copy of the sheet or a copy of the figures as they appear on the actual books of the company for this Line Second B?

A. I have a copy here of the total amount recorded on the company's books, as classified by myself, taken from the daily time sheets, as well as the daily progress reports of construction, and which any auditor or accountant can compile if he takes the time to do so.

Q. Now I will ask you, Mr. Steinberger, if the actual books of the company do not show a segregation for the construction of Line Second B?

A. If they do, they show such a segregation from the time [fol. 3255] sheets only, but not as included in the daily progress reports.

Q. I am talking about the books of your company—the capital accounts, by lines, as shown by the accounting records of the company for Line Second B, the cost is segregated into various heads, and one of the heads is construction; isn't that right?

A. That is correct.

Q. Now, the sub-heads under this construction head read as follows: Liability insurance, $5,800.22——

A. Just a second, Mr. Fitzhugh, please—all right, thank you.

Q. The next item is labor, $178,268.93. The next is welding labor, $49,528.13. The next is welding material, $47,635.38, and the welding material is separated into divisions as follows: Acetylene, oxygen, carbon, welding rod, welding equipment and miscellaneous supplies, the totals of which are carried into the welding material amount. Following that there shows teaming contract, $30,807.40. Sundry teaming, of $25,675.39. Truck earnings, $17,280.93. Tractor earnings, $17,956.88. Ditcher earnings, $23,695.50. Compressor earnings, $1,449.91. Traveling expense, $4,569.08. Tools and supplies, $29,025.81. Are those amounts correct?

A. I do not have the same division as you have just read. Apparently what you just read is a transcript of the journal entry recording it on the books.

Q. Exactly.

A. As compiled in the accounting department of the company, and so far as labor is concerned, is merely a sum-
[fol. 3256] marization of the daily time sheets, whereas I have before me a complete breakdown of the total cost of that line, in the amount of $1,975,336.64, segregating between the various labor classifications as well as accounting for every item of material.

Q. So that the division and the amounts that I have just read are the way the construction costs appear on the primary books and records of the company? Is that correct?

A. That is correct. But Mr. Fitzhugh, it would be impossible to record on the books of the company every individual item entering into the construction of a pipe line.

Q. All right. Now, in order for you to divide up this labor of $178,268.93, you had to make an analysis of the daily performance sheets that you got, and from your analysis divide up all this labor, didn't you?

A. That is correct. What I did, I summarized all the time and expense shown on the daily progress report, and tied it into the total payrolls as recorded by the daily time sheets.

Q. So that the amounts appearing in this book cost

column are really not book costs at all, but are computed figures, are they not?

A. They are book costs, and actual out of pocket expenses of the company.

Q. What do you mean by book costs? Don't you mean by book costs, the costs as shown by the books?

A. Just because an item does not appear by itself on the books, yet the over-all cost is on the books, it is still a book cost.

[fol. 3257] Q. Wouldn't it have been better if you had headed this column, Actual Cost, as computed by Mr. Steinberger?

A. And total out of pocket expense of the company, yes.

Q. Wouldn't it have been better if you had designated it as the actual cost, as computed by yourself, rather than as book cost?

A. Well, I don't know whether that is a misnomer or not, Mr. Fitzhugh, but it is the book cost and it is the out of pocket expense of the company.

Q. Well, you don't want to mislead the jury by making them think this amount shows in the exact figure as you have it here in this column, on the company's books, do you?

A. Mr. Fitzhugh, that item of $156,650.41 is just as much a book cost as One Foxborough Meter, No. A-40509, at a cost of $112.30, which is located on that particular line, and was an out of pocket cost to the company, but it does not appear on the primary records of the company, but is included in the material cost, under transmission system measuring station equipment.

Q. What was that amount?

A. $112.30.

Q. Well now, that exact figure would show on the books, would it not?

A. No, that figure does not show on the final investment records of the company; we merely have the total for transmission system measuring station equipment.

[fol. 3258] Q. But to clarify the thing for the jury's benefit, Mr. Steinberger, the books and records for Line Second B do not in any place show the amount of $156,650.41, that you have here, for the cost of excavation on that line?

A. That is correct. That amount of $156,650.41 does not appear by itself, but it is included in the over-all cost of construction.

Q. Now, turning to your second page. On this page you purport to show a comparison between Plaintiffs' Exhibit 6, and the actual book cost of transmission system property. The total for the various systems shown of $28,659,795.67 is the total that you took from Plaintiffs' Exhibit 6, is it not?

A. Yes.

Q. That is Mr. Freese's evaluation?

A. That is correct, and that is the same figure as appears on page 1, of Plaintiffs' Exhibit 6, under transmission system property.

Q. What is the comparable figure, to compare with this total, as taken from your evaluation, Exhibit 28?

A. $29,217,804.25. That figure was arrived at by taking the total shown on page 1 of Plaintiffs' Exhibit 6, under transmission system property, and on the second page, at the bottom of Defendant's Exhibit 47, of $28,659,795.67, and adding to that figure the difference in the excavation costs as used by Mr. Freese in his preparation of Plaintiffs' Exhibit 6, and the excavation cost as used in Defendant's [fol. 3259] Exhibit 28, which amount is $558,008.58. In other words, the evaluation as made by Mr. Freese is $558,008.58 less for excavation than is shown in Defendant's Exhibit 28, and adding that figure to the amount previously stated gives a total of $29,217,804.25.

Q. Now, how much lower is your evaluation, as shown by Exhibit 28, than the book cost figures you have shown on this page of $31,353,035.54?

A. $2,135,231.29.

Q. You are making that comparison with the direct structural costs as set forth in Defendants' Exhibit 28?

A. That is correct. That is based, however, by taking the reproduction cost new, as set forth in Defendant's Exhibit 28, as against some hypothetical cost as set forth in Plaintiffs' Exhibit 6.

Q. What was that last remark—read that back, will you please?

* * * * * * *

A. I mean, instead of cost, as set forth in the reproduction cost new report of Defendant's Exhibit 28, as against some hypothetical reproduction cost report, as set forth in Plaintiffs' Exhibit 6.

Q. Now, the difference between these costs as shown by your Exhibit, and as shown by Mr. Freese's exhibit, is $558,000.00 you say?

A. Approximately, yes. I believe that figure includes [fol. 3260] some of the Oklahoma lines. I do not have a complete segregation.

Q. In other words, there is a difference of about two per cent, as between the two appraisals?

A. So far as the physical property of the transmission system——

Q. Well, that is all we are talking about here on this page, is it not?

A. There is a difference of half a million dollars, which of course is included in the excavation cost.

Q. This column shown on this page is Mr. Freese's direct structural cost, isn't it, and you are comparing that with the direct structural costs as taken from Exhibit 28?

A. Well, it is the direct structural costs as set forth in Defendant's Exhibit 28, with Mr. Freese's adjusted excavation costs.

Q. They are comparable figures, aren't they, in every respect?

A. They are the same figures, except for the excavation costs.

Q. And the only difference between the two is only about two per cent, isn't it?

A. Two per cent of the total book cost, or two per cent of the difference?

Q. Two per cent of the book cost?

A. That is correct.

Q. Now, you say Mr. Freese's figure is about eight per cent less than the book cost; is that correct?

A. Yes.

Q. And yours would be about six per cent less, wouldn't it?

A. That is correct.

[fol. 3261] Q. In other words, this whole thing shows that there is not much relation between the book cost and the figuring out of a reproduction value for the same thing?

A. Well, the figures show that Mr. Fitzhugh, but the appraisal, or rather the figures as set forth in Defendant's Exhibit 28 are based 100 per cent on the reproduction cost new basis, whereas the figures used and arrived at in

Plaintiffs' Exhibit 6 in the report itself, is not a reproduction cost new report.

Q. Well, that is your opinion about it, isn't it?

A. Yes.

Q. And that is exactly contrary to what Mr. Freese testified to?

A. That may be true, but I have never seen a report of that kind, and I have seen plenty of reproduction cost new reports in my day.

Q. All right; now the two per cent difference between the costs found in your exhibit, or the company's Exhibit 28, and Mr. Freese's Exhibit 6, is more than made up by the allowance in Exhibit 28 for omissions and contingencies. Isn't that correct?

A. The difference of half a million dollars?

Q. Yes.

A. Total omissions and contingencies as used in Defendant's Exhibit 28, covering both Texas and Oklahoma properties——

Q. Well, wait now, just a minute, Mr. Steinberger. I am talking about the omissions and contingencies that would be included in the lines included in this book cost figure of a total of $31,000,000.00 plus.

* * * * * * *

[fol. 3262] A. The total amount of omissions and contingencies as included in Defendant's Exhibit 28, for the transmission system property, including all the property in Texas and Oklahoma, is $681,416.72.

Q. So that the difference would be explained simply in the item of omissions and contingencies, wouldn't it?

A. I don't see what the item of omissions and contingencies has got to do with that figure. That is another item of expense. You can not substitute one expense for another, Mr. Fitzhugh.

Q. Well, I will ask you the question in this way: If Mr. Freese had made the same allowance for omissions and contingencies that you made, he would have gotten a little higher figure than you did, wouldn't it?

A. Yes, but that hasn't anything to do with it.

Q. As a matter of fact, on some of these lines, he did get a little higher figure than you did, anyway?

A. That is correct. Those lines were built away back i 1909 and 1910, and prices were considerably lower, and s were the labor costs.

Q. That's all.

* * * * * * *

[fol. 3263] Redirect examination.

Questions by Mr. Griffith:

Q. Mr. Steinberger, sheet 1 of Defendant's Exhibit 47 i a reflection of a comparison of excavation costs with th actual costs, is it not?

A. That is correct.

Q. Now, if you put too much rock into a certain line, o estimated too much rock in any one of the six lines, or to much hand-earth excavation or too much machine excava tion, would that make any difference as to the over-all cost of excavation on that particular line?

A. It certain- would not, Mr. Griffith.

Q. Now, Mr. Steinberger, did I request you to prepar this exhibit?

A. You did not, Mr. Griffith.

Q. Didn't you suggest that a proper method of compar son would be to take some one-half dozen of the majo construction projects?

A. That is correct.

Q. And for which you had the actual performance re ords?

A. That was my suggestion.

Q. And covering the actual costs incurred by the Com pany?

A. Yes.

Q. And is that what you have set forth on page 1 Defendant's Exhibit 47?

A. That is just what I have set forth on Defendant Exhibit 47, and if I had used different lines, the differen [fol. 3264] would be about the same on the over-all excav tion.

Q. That's all.

Recross examination.

Questions by Mr. Fitzhugh:

Q. In other words, to sum it all up, Mr. Steinberger, y took a little study of about 250 miles of pipe, of all t

sizes of pipe and all trench sizes, where you were not actually able to segregate the laborers hours, for the various classes of excavation, and applied that to the whole system, consisting of 4,000 miles of pipe lines?

A. There is to be exact, 290.6 miles that I have included in this study, and I made an over-all study of 450 miles, which is slightly in excess of about twelve per cent of the total mileage in the system, and I do not know of a better cost basis than the actual experience of the company.

Q. But the figures that you have used were figured out from your study of the 290 miles; isn't that right—on all sizes of pipe?

A. In connection with Defendant's Exhibit 47. The reason that I used the six lines is because they covered all sizes of lines from three inch outside diameter of pipe to twenty inch outside diameter of pipe, and would be typical of the system as a whole system, and if I had used various lines, the difference would have been about the same. You will recall that Mr. Freese's costs that he gave on Line E-5 before the Railroad Commission hearing, were seventy per cent [fol. 3265] below the book costs, and I did not include that line in this study. On Line A-1-4, his costs were about 36 per cent below the book costs.

Q. And on the same line, Mr. Steinberger, how far were you below the book costs?

A. On E-5 I was 37 per cent below the book costs.

Q. Yes, and whatever you might have been below the book costs has got nothing in the world to do with your performance study, has it? You still only studied 290 miles of construction for the purposes of your first page in this exhibit?

A. I took six representative lines——

Q. Yes.

A. Amounting to 290.6 miles in length.

Q. Yes, sir.

A. And I used them for comparative purposes, because those lines are fairly representative of the lines in the system, covering from three inch outside diameter to twenty inch outside diameter.

* * * * * * *

[fol. 3266] R. L. THORNTON, a witness for the defendant, having been duly sworn, testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. What is your name?
A. R. L. Thornton.
Q. Where do you live?
A. Dallas, Texas.
Q. Are you connected with any banking institution in the City of Dallas?
A. Yes, sir.
Q. What banking institution?
A. Mercantile National Bank.
Q. Is that a rather sizable banking institution?
A. Medium sized bank.
Q. Having total assets of what amount, Mr. Thornton?
A. About twenty million.
Q. Mr. Thornton, how long have you been engaged in the banking business?
A. About seventeen years.
[fol. 3267] Q. Do you have a general familiarity with the yields commonly and currently expected, demanded and received by investors in securities?
A. I think I do, generally, yes, sir.
Q. In connection with your banking business, have you had occasion to buy and sell and be familiar with the yields on securities of several types?
A. Generally, yes, sir, many varied types.
Q. Do you have a general familiarity with the business of Lone Star Gas Company, the defendant in this case—that is, do you know that it is engaged in the production, transportation, and sale at wholesale of natural gas to some three hundred towns, cities, and communities in southern Oklahoma and in central, northern, and western Texas?
A. Yes, generally, I know those things.
Q. Mr. Thornton, have you had some experience in connection with the financing of natural gas enterprises?
A. We have had some in the smaller companies in that section of the country.
Q. In the general section—in the general southwestern territory?
A. Yes, sir, and some in Arkansas.

Q. And as the result of the financing of those enterprises, have you become familiar with the security markets, [fol. 3268] in a general way, relating to natural gas securities?

A. I would say, in a general way, yes.

Q. Based upon your knowledge and experience, Mr. Thornton, what net annual rate of return do you think would be necessary for Lone Star Gas Company, in order to attract a free flow of capital for investment in the enterprise, to enable it to raise the money necessary for the discharge of its public service obligations, to support and maintain its credit, and generally to insure the financial soundness of the enterprise?

Mr. Fitzhugh: Just a second. I would like to ask some questions before making an objection.

Mr. Griffith: Yes, sir.

Examination by Mr. Fitzhugh:

Q. Mr. Thornton, how many gas companies have you ever had anything to do with, so far as financing is concerned?

A. Three.

Q. All small companies?

A. They are smaller as compared to the Lone Star Gas Company, yes, sir.

Q. Yes, sir. What was the amount involved in the loan obtained by the largest one?

[fol. 3269] A. Well, we participated with Lamport & Company, of New York, in the underwriting of the Arkansas & Western Gas, and I believe that was about a million dollar underwriting; I can't remember exactly.

Q. Yes, sir.

A. The Pecos Valley Gas—we underwrote that ourselves and took all of the issue; that was, I believe, $450,000.00; and then we have bought into syndicates, but had nothing to do with the underwriting; and Northwest Texas Gas was a small company—we took all of that and underwrote it; and I forget what that amount was, but a smaller underwriting than the others—in bonds, I have reference to.

Q. You are familiar enough with banking projects throughout the State of Texas, and with the financing done

by gas companies—enough to know that no sizable financing for a gas property has even been given to the bankers of Texas—isn't that correct?

A. Well, I would say it was correct in so far as giving it to the bankers of Texas.

Q. Yes, sir.

A. I think the bankers of Texas interests have participated in other underwriting syndicates.

Q. Exactly; but the Lone Star Gas Company has never floated any of the loans for, say, as much as five or ten mil-
[fol. 3270] lion dollars, in a Texas bank, has it?

A. So far as I know, not.

Q They take all of that business to Pittsburgh and New York, do they not?

A. I don't know where they take it.

Q. Would you have any idea about the details and could you give any sort of an idea as to interest rates that would be required and the conditions of the market generally in the absorption of an issue of first mortgage bonds big enough to build and finance the building of a property claimed to be worth seventy-four millions of dollars—a gas property comparable to the Lone Star Gas Company?

A. I think I have a general idea of what the market would absorb on an issue of a sizable type, because, obviously, if it were a seventy-four million dollar property it wouldn't be a seventy-four million dollar bond issue.

Q. But you have never participated in any actual financing of a gas pipe line in an amount like that?

A. Not initially, but we bought a large issue of Associated Gas.

Q. Yes, sir. Well, the Associated Gas Company is in no way comparable, either in its operations or its location or its business, to the Lone Star Gas Company, is it?

[fol. 3271] A. I don't know whether it is or isn't.

Q. Don't you know what the Associated Gas Company is?

A. I know generally, but not specifically, because it is a good ways away from us.

Q. Is it an artificial gas company or a natural gas company?

A. I don't know.

Q. That would mean a world of difference, wouldn't it?

A. What would mean a world of difference?

Q. In the salability of bonds, whether a company is an artificial gas company or a natural gas company.

A. I think it would make a difference.

Q. You know, as a banker, don't you, that the artificial gas company bonds are considered among the very best of securities?

A. Well, they may be considered that. I wouldn't say that they were.

Q. That is a very conservative business.

A. I happened to know of some of them that had to go out of business, and the bonds were not very good at all. Artificial, I have reference to.

Q. Well, you know that the natural gas companies' bonds are not considered as good investment——

A. I wouldn't say they were not. As compared to artificial gas?

[fol. 3272] Q. Yes, sir.

A. No, sir, I wouldn't consider them so.

Q. All right.

* * * * * * *

Direct examination resumed.

By Mr. Griffith:

Q. Mr. Thornton, based upon your knowledge and ex-
[fol. 3273] perience, what minimum net annual rate of return do you think Lone Star Gas Company should receive?

A. On its property value?

Q. Yes, sir.

A. Well, I would say not less than eight per cent.

Q. Would that be an absolute minimum?

A. That would be a minimum after depreciation and depletion.

Q. A minimum after all proper depreciation and depletion charges?

A. Yes, sir.

Cross-examination.

Questions by Mr. Fitzhugh:

* * * * * * *

[fol. 3274] Q. Well, without going into detail, then, Mr. Thornton—isn't it a fact that your bank, just like all the

other banks in our country at the present time have a much stronger cash position than they have had in the last twenty years?

A. I think that is generally true.

Q. And there is more money available for loans now than there has been for years and years?

A. For certain types of loans.

Q. Yes, sir. Does the Lone Star Gas Company have any loan outstanding with your bank at the present time?

[fol. 3275] A. Yes, sir.

Q. Is that a short-time loan?

A. A current 90-day loan.

Q. Is it secured in any way?

A. No, sir, open.

Q. Just an open account?

A. An open loan—an unsecured note.

Q. Yes, sir; it is just evidenced by a promissory note, is it?

A. That is right.

Q. A demand note?

A. No, a ninety day note.

Q. Yes, sir. What rate of interest does this note bear?

A. I can't recall; four or four and one-half, but I wouldn't be positive either way, because I don't recall.

Q. Four or four and one-half?

A. Four or four and one-half, something like that.

Q. Yes, sir. What is the size of the loan?

A. $25,000.00.

Q. If I understand you correctly, you have loaned the Company $25,000.00 for ninety days, at either four or four and one-half per cent?

A. Correct.

[fol. 3276] Redirect examination.

Questions by Mr. Griffith:

Q. Mr. Thornton, would the current rate or the rate on a current loan, such as this 90-day loan that you speak of, be indicative to any extent of what the Company would have to pay in connection with permanent financing?

A. Not the slightest bearing.

Q. Not the slightest connection?

A. No, sir.

Recross examination.

Questions by Mr. Fitzhugh:

Q. Mr. Thornton, does the Company also have deposits in your bank?

A. I don't think the Lone Star Gas has a deposit with us. I think probably the Lone Star Gasoline Company does.

Q. Well, that is a branch of the Lone Star Gas Company, isn't it?

A. Yes, sir, some subsidiary of the corporation.

[fol. 3277] Q. There is no separation of companies, is there? It is just the Lone Star Gasoline Department of the Lone Star Gas Company.

A. Well, my understanding is it is the Lone Star Gasoline Company, some subsidiary of the corporation.

Q. Well, perhaps that is right.

A. Yes, sir.

* * * * * * *

Fred F. Florence, a witness for the defendant, having been duly sworn, testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. State your name, please?

A. Fred F. Florence.

Q. Where do you live, Mr. Florence?

A. Dallas, Texas.

[fol. 3278] Q. In what business are you engaged?

A. Banking business.

Q. Do you have a business connection with any banking institution in the City of Dallas?

A. Yes, sir.

Q. Do you have any official connection with that bank?

A. Yes, sir.

Q. What is the official connection, and what is the name of the banking institution with which you are identified?

A. I am President of the Republic National Bank and Trust Company of Dallas.

Q. Is that a sizable banking institution, Mr. Florence?

A. Well, it is the second largest financial institution in the Eleventh Federal Reserve District.

Q. And what is embraced and included in the Eleventh Federal Reserve District?

A. All of the State of Texas, part of Louisiana, and the southern part of Oklahoma, and part of Arkansas.

Q. Mr. Florence, how long have you been engaged in the banking business?

A. Approximately twenty-eight years.

Q. Are you generally familiar with the yields commonly and currently expected, demanded, and received by investors in the several classes or types of securities?

[fol. 3279] A. I think so.

Q. In connection with your banking activities, have you had occasion on behalf of the banking institutions with which you have been identified, to buy and sell securities in large amounts?

A. Yes, sir.

Q. Have you ever participlated in any natural gas financing?

A. Yes, sir.

Q. Are you able to recall the financing in which you did participate?

A. I have in mind now the Houston Gulf Gas Company.

Q. Will you speak out just a little louder, Mr. Florence?

A. The Houston Gulf.

Q. The Houston Gulf Gas Company?

A. At Houston, a natural gas company there.

Q. That is a natural gas pipe line company transporting gas from the Refugio County Field to the City of Houston, is it not?

A. Yes, sir.

Q. Do you have a general familiarity with the business of the Lone Star Gas Company, Mr. Florence—that is, do you know generally that the Company is engaged in the production, purchase, transportation, and sale at wholesale of natural gas to some 300 towns and cities in the southern [fol. 3280] part of Oklahoma and in northern, central and western Texas?

A. Yes, sir.

Q. I believe, Mr. Fitzhugh, in addition to being President of the Republic National Bank & Trust Company, you are also connected with the Dallas Clearing House, are you not?

A. Yes, sir.

Q. Do you occupy any official position with the Dallas Clearing House?

A. I am President of the Dallas Clearing House Association.

Q. What is the Dallas Clearing House Association?

A. It is the association of all of the banks of the City of Dallas.

Q. Mr. Florence, based upon your knowledge and experience, what net annual rate of return would be necessary for Lone Star Gas Company in connection with its public service business?

A. Will you state that question again, please, sir?

Q. Based upon your knowledge and experience in connec- [fol. 3281] tion with the yields on securities commonly accepted, demanded, and received by investors in securities, what net annual rate or return do you think Lone Star Gas Company should be entitled to receive?

A. You mean upon its property values?

Q. Yes, sir.

A. I should say a minimum of eight per cent upon its investment.

Q. And that would be a minimum net annual return?

A. Yes, sir.

Q. And would that be after all depreciation and depletion charges had been taken care of in connection with operating expenses?

A. Yes, sir.

Q. And do you believe that a minimum rate of eight per cent for net return would be necessary to insure the financial soundness of the Company and to support and maintain its credit?

A. And to protect its securities in the hands of its investors, I do, at least that, yes, sir.

Cross-examination.

Questions by Mr. Fitzhugh:

Q. Mr. Florence, your bank has in connection with it an [fol. 3282] investment department, does it not?

A. It had until recently; we have just recently discontinued the active operation of the investment department.

Q. But you are thoroughly familiar with the marketing of investment securities as it is done in Dallas?

A. Yes, sir.

Q. Did you bank, at the time the Lone Star Gas Corporation floated its issue of Debenture Fives, participate in the marketing of those securities?

A. Yes, sir.

Q. Did you have any trouble selling those bonds to the public?

A. At that particular time we did not.

[fol. 3283] Q. Now, those bonds were absolutely unsecured, were they not?

A. Well, they—except by the credit of the Lone Star Gas Corporation and certain indentures restricting their operations and activities upon a certain basis. There were a good many conditions to it. They were not secured as to any specific security, but the conditions and covenants in connection with the flotation were quite definitely worked out.

Q. You mean there were certain sinking fund provisions for the retirement of the loan, but there was not behind it a single dollar's worth of property for the bondholders to go back to in the case of default on the issue, was there?

A. It was predicated—I think that is correct; that is my recollection.

Q. Now, those bonds only had a five per cent coupon, didn't they?

A. That is correct.

Q. Don't you know, as a matter of fact, as a banker, Mr. Florence, that an investor, or rather a borrower of money, who is able to give good security for his borrowing, can always get a lower rate of interest?

A. That would not always follow.

Q. If I were to come to your bank and seek to make a loan, giving you only a promissory note, wouldn't I have [fol. 3284] more trouble getting that loan, and wouldn't I be likely to have to pay a higher rate of interest, than if I came with tangible security, say, a house and lot, or a bond, or some other sort of collateral to put up to cover my loan dollar for dollar?

A. That is not correct, for this reason: You can take the International Cement Company—their bonds are selling down to about 85 right now, but that corporation can go in to any bank in the country and borrow short-term money today at less than one per cent, although their bonds are selling at a discount.

Q. I am not talking about that. I am talking about the

relative difficulty that any borrower of money would experience at the same time as between in one instance having security for the loan he attempts to make, and in the other instance having no security.

A. You have reference to the same borrower in both cases?

Q. Yes, sir.

A. It would altogether depend upon many factors. There are times when they could borrow as cheap on a straight debenture, and yet varying conditions might make a change.

Q. As a general thing, as a banker, you know that you do not pass up an opportunity to get a little security for your loans?

[fol. 3285] A. We don't presume to make anything but good loans.

Q. I am talking about good practice, and the usual practice, and the ordinary practice—any banker tries to get a loan secured?

A. No, sir; we loan to many concerns on their open note. Of course, if we didn't think they would be good, we would ask for security.

Q. You don't mean that you would rather have an unsecured loan than a secured one?

A. I could name you dozens of firms that we would just as soon have their open notes—General Motors, for instance, and I could name you dozens of similarly situated concerns, where we would take their open note any time.

Q. What is the most your Company ever loaned to the Lone Star Gas Company?

A. I think as high as five hundred thousand dollars.

Q. I will ask you this question: In the making of that loan would you have rather have had an open promissory note unsecured for $500,000.00, or one wherein the Lone Star Gas Company pledged in a deed of trust a first mortgage upon some, say, two million dollars worth of its property?

A. Well, I will tell you what we did have; and that is probably the best answer.

Q. All right.

A. We would not have loaned the Lone Star Gas Com-

[fol. 3286] pany five hundred thousand dollars on a mortgage, but we loaned it that money as a temporary loan for current operative purposes, with the definite understand-

ing that it would be paid in January or February, when their receipts came in. We would not have made that loan under any other conditions.

Q. Your bank was simply dealing in short-time paper, and not trying to do any financing for the Company?

A. That is correct.

Q. But suppose you had been undertaking a loan of some size, say in the amount of five hundred thousand dollars, that was to run for sometime, would you have just as soon as accepted the Lone Star Gas Company's promissory note unsecured, or would you have insisted upon some sort of tangible security?

A. As a general thing, in banking, a secured obligation is more desirable than an open obligation; but there are many exceptions to that rule.

Q. Exactly. Now, if you were able to sell the Lone Star Gas Corporation's debenture five's, unsecured as they were, wouldn't you have had an easier time in selling a first mortgage bond of the Lone Star Gas Corporation, assuming that there was seventy-four million dollars worth of property behind the issue, and that the issue of first mortgage bonds only amounted to thirty million dollars, or less than half the total assets, if those bonds had borne five per cent coupons, or the same as the debenture issue? [fol. 3287] A. Well, at that particular time there was a market situation involved in it, and that was a frenzied speculative market on the part of the public, where they were buying any sort of security, and not going into the full details and operation records of the Company as carefully as today; and, as a result, there was lots of financing went on at that time that should not be considered a criterion of what financing—sound financing is today. At the time that financing was done, it was considered to be sound; but frankly, today, that would be considered very unsound from a financial investment point of view.

Q. Have you sold any of the bonds of gas companies that have been lately sold?

A. None that I have sold recently, no.

Q. There has not been any financing in gas companies, has there?

A. Not of any consequence.

Q. So there is not any way to judge what would have been done in the case of gas companies at the present time?

A. Well, I think those experienced would have a pretty good idea as to about what would have been done.

Q. Have you participated directly in any financing of gas companies in this section of the country?

A. As I stated we had been interested in some of the syndicates and took some of the bonds of those I mentioned.

[fol. 3288] Q. Have you taken any bonds other than those?

A. From time to time we have taken what we call banking syndicate participations in reasonable amounts, but not large amounts. We have never been very strong on gas securities.

Q. How big is the Houston Gas Pipe Line Company?

A. I have not been in touch with it recently, and I could not tell you.

Q. What kind of security was behind the bonds in that issue?

A. They issued about every kind of conceivable security at one time or another, straight bonds, closed first mortgage bonds, and others. I think we were interested in the closed first mortgage bonds.

Q. The closed first mortgage bonds?

A. Yes, sir.

Q. It was a junior issue to several others, was it not?

A. No; it was a six per cent closed first mortgage issue that we were interested in.

Q. Of what maturity?

A. I don't recall.

Q. You are not able to say whether there had been prior issues?

A. This particular issue, my recollection is that it was a first mortgage bond issue. Probably they were allowed to issue more later.

[fol. 3289] Q. So this issue was not a closed issue?

A. Well, as I said, I would not want at this time to testify as to the exact facts concerning that issue, as it has been a number of years ago, and I would not want to say now just what it was; that is just my recollection. I would not say positively as to any of the details pertaining to that or any other issue.

Q. You know that it makes a world of difference whether a mortgage is a closed mortgage on specific property, or an

open mortgage that can be extended by additional issues that can be marketed from time to time?

A. There is a difference, but whether it affects it favorably or unfavorably would depend upon the particular situation.

Q. All of the sales ever made in Dallas, whether by your company, or any other company, are simply trades made over the counter in the various investment banking departments, are they not?

Q. How do you mean?

Q. There is no exchange in Dallas, is there?

A. No, sir.

Q. When you buy bonds you simply buy from some issuer of securities or perhaps some investment banking house, and then sell them off your shelves, just like a grocer sells off sacks of flour?

A. That is the general way we used to do, but not any more.

[fol. 3290] Q. There are no sales made over an exchange in Texas anywhere, is there?

A. I think that is correct.

Q. Are you familiar with Fitch's Manual?

A. Yes, sir.

Q. That is a manual that records the actual sales made on the New York Stock Exchange or on the New York Curb, is it not?

A. I think that is correct.

Q. It does not record any of the sales made as over the counter sales in New York, Chicago, Boston, Pittsburg, of other cities of the United States?

A. I doubt if I would be qualified to state what Fitch's Manual contains.

Q. It does record the actual sales on the Exchange, though?

A. That is my general understanding.

Q. Since it is based on that, it could not include over the counter sales?

A. I am not sufficiently familiar with Fitch's Manual to testify intelligently on it.

Q. Maybe you can tell me this: Aren't at least ninety-five per cent of the actual sales of bonds and securities,

which would include all of the unlisted securities, made by over the counter sales, rather than sales actually made on the exchange?

[fol. 3291] A. Well, as to sales made on bonds listed on the Exchange, they are largely based upon prices prevailing on the Exchange; and those not listed on the New York Exchange are more or less sales over the counter. That applies as a general rule, subject to exceptions, of course.

Q. And the unlisted, are none of them sold through the Exchange?

A. No. sir.

Q. But are all sold over the counter; isn't that correct?

A. Generally speaking.

Q. And the unlisted bonds very greatly out-number the listed bonds both in the amount of issues and the number of issues; isn't that correct?

A. Well, if you are talking about the bonds, whether they are listed on the New York or other bond exchanges, as compared with all other bonds not listed on any exchanges, or course, there are more not listed than listed, taking the country as a whole; that is, in numbers; but not necessarily in amounts.

Q. That being true, Mr. Florence, a study of simply the sales of listed securities—that small class of bonds actually listed on the exchanges—would not serve to show the general market condition, would it?

A. Well, it would be, in my opinion, the truest index as to market condition. It is not the smallest group; upon [fol. 3292] the New York Exchange are listed the largest bond issues in this country.

Q. Well, anybody can list bonds?

A. But they cannot control the price of them.

Q. All you have to do to list a bond is to furnish the Exchange officials the data that will satisfy their requirements?

A. There is a good deal more to it under this Federal Securities Act right now.

Q. And pay your fees?

A. Yes, sir.

Q. And what else?

A. All sorts of reports are required by the Federal Government as to the listing of any securities on the Exchange.

Q. That is the only difference between the listed and unlisted—fulfilling of requirements of the exchange, and payment of the fees?

A. I don't think that would be a fair statement to make as to exchanges, because I think exchanges perform a necessary function in industry, and they impose a great many conditions upon corporations as to supplying information concerning their affairs, that unlisted securities do not have to give at all.

Q. Does the Company have any loans with your bank at the present time?

[fol. 3293] A. I think they have a small loan at this time.

Q. What is the rate of interest charged?

A. I think they have a loan of fifty thousand dollars—current loan; and according to my recollection of the rate, it was five per cent, and we later reduced it to four or four and a half per cent—I am not sure about the rate. Of course, that is purely a current and temporary loan.

Q. You agree, do you not, that the banks of the country, generally, are maintaining a much stronger cash position then they formerly had?

A. Yes, sir.

Q. And that would reach as far back as a twenty-year period, would it not—that is the liquidity of the banks as compared with the twenty-year period previous would show a greater amount of cash and liquid securities on hand than ever before?

A. I should think so, yes, sir.

Q. About what are the assets of your bank?

A. Something in excess of seventy million dollars.

Q. You are about the biggest bank in this part of the country, are you not?

A. As I said, the second largest, according to the figures of the Eleventh Federal Reserve District.

Q. Notwithstanding the fact that you are one of the [fol. 3294] largest banks in Texas, you have never been allowed to participate in the financing of any of the gas companies connected with the Lone Star Gas Corporation, have you?

A. Our participation in those securities has been to take care of the demands we had from our customers for the securities. We have never been very favorably inclined

to those types of securities, because we consider them quite speculative.

Mr. Fitzhugh: That is all.

Redirect examination.

Questions by Mr. Griffith:

Q. Would the rate on current loans be indicative at all of the coupon rate or yield in connection with securities issued for permanent financing?

A. It would not. As I just mentioned, in the case of the International Cement Company, whose 5 per cent bonds are selling at 80 cents on the dollar, yet they can borrow money at three-quarters of one per cent.

Q. That would be on a short loan?

A. Three or six months loan.

Q. You stated that natural gas securities were considered speculative?

A. Yes, sir.

[fol. 3295] Q. I will ask you if bankers and investors generally regard the natural gas business as a hazardous business, Mr. Florence?

A. I so regard it; and I think it is so regarded by conservative bankers as being fairly speculative and hazardous. It has proven that way over a period of time.

[fol. 3296] Cross-examination.

Questions by Mr. Fitzhugh:

Q. In making your answer as to the rate of return you think this company would have to have, have you been informed as to the gas reserves the company has?

* * * * * * *

A. Well, I have taken that in the light of my experience over a long number of years as a practical thing. As a matter of fact, I do not believe this company, even if they had an authorized return fixed by the State of Texas, that it could float any sizable bunch of securities at this time at any rate of interest up to that amount.

Q. Well, now, answer my question, if you don't mind. Do you know what the gas reserves of the company are at the present time?

A. Of the Lone Star Gas Company?

Q. Yes.

A. I could not answer that question.

Q. Do you know what the estimated life of the gas reserves is?

A. I could not answer that.

Q. Do you know what the earnings of the company were last year?

A. Well, I have seen, of course, the figures, and I see them almost daily in our bank, as to the reserves and the estimated life of their gas and the exact dollars of their earnings and everything like that, but, doing business with so many companies, I don't remember them exactly. We [fol. 3297] have in our bank a complete report, but I don't remember the figures, nor those technical questions. For the purpose we had at the time they were satisfactory to the Credit Department.

Q. Do you know what the value of this company's properties are—or is?

A. Well, it is reputed to be considerably up in the millions of dollars.

Q. Yes, sir. Do you know the exact amount?

A. Well, I have heard all sorts of figures talked about.

Q. Well, when you say what rate of interest this company would require for the floating of any loan you have to take into consideration its financial condition?

A. Oh, indeed so.

Q. Well, now, what do you consider the assets of this concern to be?

A. Well, on paper they are one thing and what I would make loans on would be another, but they are supposed—I have heard the figure mentioned since I have been here, somebody sitting out there a while ago, seventy million dollars.

Q. Did you make your calculations assuming that to be the true value of the property?

A. Well, I don't have the figures in my mind, but it happens our bank has a number of loans on stock of the Lone Star Gas Corporation, and we have from time to time been concerned about it and we have made a study of it and of [fol. 3298] the net result of it, but I don't attempt to carry those figures in my mind; but, based on the information I have available, the statements I have made would govern.

Q. You mean that stock of the Lone Star Gas Company has been deposited in your bank for loans?

A. In reasonable amounts from time to time. It is worth about five dollars a share—that is, of the Lone Star Gas Corporation, not the Lone Star Gas Company.

Q. I see.

A. No, we have never had any Lone Star Gas Company stock.

Q. Do you know what the operating expenses of the company were for the year 1933?

A. I would not want to attempt to testify as to any specific figure.

Q. Do you know what the amount available for return after allowance for operating expenses and depreciation was before payment of Federal income tax?

A. Well, I dare say that I could not give you that information concerning a specific company unless I had it currently and had just gone over it. We have not had under consideration recently any question involving that particular information—having that particular information available; in other words, I have not been devoting any time to the Lone Star Gas Company whatever in our bank.

* * * * * * *

[fol. 3299] R. L. THORNTON, recalled by defendant, testified further as follows:

Direct examination.

Questions by Mr. Griffith:

Q. You are the same R. L. Thornton who just previously testified in this case?

A. Yes, sir.

Q. I forgot to ask you, Mr. Thornton, your official connection with the Mercantile Bank of Dallas.

A. President.

Q. How long have you been President of the bank—ever since its organization?

* * * * * * *

Mr. Griffith: Now we want to call Mr. A. P. Holloway.

A. P. Holloway, a witness for defendant, having been duly sworn, testified as follows:

[fol. 3300] Direct examination.

Questions by Mr. Griffith:

Q. Your name is A. P. Holloway?
A. Right.
Q. Where do you live, Mr. Holloway?
A. Dallas, Texas.
Q. In what business are you engaged?
A. Steel business.
Q. With what steel concern are you identified?
A. Jones & Laughlin Steel Corporation, headquarters Pittsburgh, Pennsylvania.
Q. Is that one of the major steel corporations of the United States?
A. It is.
Q. It is one of the larger manufacturers of plain end steel pipe and threaded and coupled steel pipe?
A. It is.
Q. How long have you been in the steel business?
A. Since the fall of 1907.
Q. In other words, over a period of twenty-seven years?
A. Correct.
Q. What is your official connection with the Jones & Laughlin Steel Corporation?
A. District Sales Manager.
Q. As District Sales Manager of Jones & Laughlin Steel Corporation, what is the scope of your activities and the gen-
[fol. 3301] eral scope of your duties?
A. Sales work, sales promotion work, field work, in Texas, Oklahoma and New Mexico.
Q. In other words, then, as District Sales Manager of Jones & Laughlin Steel Corporation your territorial jurisdiction extends over the State of Texas, the State of Oklahoma, and the State of New Mexico?
A. Right.
Q. Are you familiar with the current prices of steel pipe, of both plain and and threaded and coupled pipe?
A. I am.
Q. Prior to the time that you came on the stand were you handed by some representative of the Lone Star Gas Com-

pany a copy of an exhibit which has been introduced in evidence here and styled Defendant's Exhibit 33 and showing on the title cover "Lone Star Gas Company—Pipe Prices—Large Lots"?

A. I was.

Q. Do you have a copy of that exhibit with you?

A. I do not.

Q. Well, will you take this copy, Mr. Holloway, and examine it?

A. This is the copy that I examined.

Q. This is the copy that you examined. Have you checked the large lot prices on steel pipe as set forth in Defendant's Exhibit 33 to determine whether those were the large lot prices which were current as of June 11, 1934, and current as of this date, to-wit: July 11, 1934?

[fol. 3302] A. I have.

Q. Are the prices as set forth in Defendant's Exhibit 33 the correct prices for large lot deliveries and sales of plain end steel pipe and threaded and coupled pipe as of June 11, 1934, and continuously down to the date that you are now testifying?

A. They are.

* * * * * * *

[fol. 3303] Q. Mr. Holloway, I will ask you this question: Are the prices for the purchase of large lots of pipe as set forth in Defendant's Exhibit 33 the absolute, rock-bottom prices and to which no price discounts are applicable?

A. They are.

Q. If the Lone Star Gas Company were today in the market for extremely large quantities of pipe could any discount be obtained below the quoted prices for steel pipe in large lots as set forth in Defendant's Exhibit 33?

A. They would not, and unless the tonnage which you speak of were for a specific project this price basis would [fol. 3304] not apply and higher prices would apply.

* * * * * * *

Cross-examination.

Questions by Mr. Fitzhugh:

Q. Mr. Holloway, what is the price today of plain end 18-inch 53.223 pounds per foot pipe? Wait a minute. Can't you answer without checking up?

A. No, sir, absolutely, I could not. I have checked those figures.

Q. How?

A. Checked them by my schedules and various other methods of computation.

Q. Have you your schedule with you?

A. No, sir.

Q. When did you check those?

A. Last night until three o'clock this morning.

[fol. 3305] Q. Do you mean to say that you went through every pipe price in that exhibit in that time?

A. I checked it and found the basis for figuring correct.

Q. But you didn't check the prices, did you?

A. Absolutely checked prices.

Q. Each price?

A. I went over it and used the basis, and from there on it is mechanical.

Q. Mr. Holloway, don't you know it would take about three weeks to check each price in that book?

A. It would not.

Q. Has the Lone Star Gas Company ever bought any steel pipe from you?

A. Yes, sir.

Q. In very small quantities?

A. In very small and very large quantities.

Q. What is the largest amount they bought from you?

A. I could not say.

Q. Do you mean that they bought from you through your department or from the Jones & Laughlin Steel Corporation at Pittsburgh, which?—did they buy from you or from Pittsburgh?

A. Through the general office in Pittsburgh.

Q. So you didn't handle the transaction at all?

A. Not through my office.

Q. You don't know what discount they got on the purchase?

A. If they were purchased during the period expressed in [fol. 3306] this report here, they got those prices and no other.

* * * * * * *

Q. Well, can you refer to an actual purchase of pipe made by the company for a major pipe line job during the year 1932 or the year 1933?

A. No, sir.

Q. Can you back of that time?

A. No.

Q. You can't give any actual purchase?

A. No.

Q. Now without knowing the actual purchases, how would you know what discounts have been?

A. Discounts would be in line with the discounts at that time.

Q. Well, you mean if discounts were applied in connection with the quoted discounts?

A. They would be applied.

* * * * * * *

A. They would be applied.

[fol. 3307] Q. Mr. Holloway, don't you know that your company, whenever it sells pipe to any of the Lone Star Gas Companies, the Lone Star Gas Company or the affiliated companies which are the underlying companies of the Lone Star Gas Corporation, as well as when your company sells pipe that goes into the Columbia Gas & Electric system, that you deal directly with Mr. Simpson?

A. That is my understanding; I am in the district office.

Q. Now, you don't have anything to do with those transactions, do you?

A. No.

Q. Do you know Mr. Simpson?

A. Not personally.

Q. Have you ever seen him?

A. If I have seen him it was many years ago.

Q. Can you give an instance of an actual purchase of pipe at any time from your company, where the Lone Star Gas Company actually paid your company the quoted price?

A. I can not.

Q. Where is the main office of your company?

A. Pittsburgh, Pennsylvania.

Q. Where is your main plant?

A. We have two plants, one at Pittsburgh and one at Aliquippa, about twenty-five miles down the Ohio River from Pittsburgh.

Q. Now, Mr. Holloway, a letter has been written by engineers for the Commission, to try to find out the discounts that apply on pipe. Assuming that the information ob-

tained reads as follows, I wish you would answer if this [fol. 3308] information is substantially correct; the letter reads as follows:

"Referring to your telegram received in Bethlehem in regard to discounts on pipe, I called at your office several times since returning to tell you but found out that you would not be back for several weeks and that you may need this information now. I found out that the discount is the same to all carload buyers on pipe. However, any pipe mill can lower their prices in a specific quotation for an identified project and then file the new price and maintain that price for the balance of the current quarter in which the price was quoted. Thus, if Mr. Simpson wishes to buy 6,000 tons of pipe, the chances are very likely that any one of the mills would give him a special price and then apply that price for the balance of the quarter. This information is secured from two pipe mills. The information received at Washington was that the prices would all be the same, regardless."

And there are then some parts of the letter referring to the Code, and which have been ruled out in this case. Now, I will ask you if the part that is read substantially states the facts?

A. You are referring to operations under the Code, are you?

Q. I am talking about the present prices that would apply, and the discounts.

A. Which is under Code regulations. Any member of the Code may file a new price, and the price to become ef- [fol. 3309] fective ten days after the date of filing.

Q. Then that price would be maintained for the rest of the quarter as to that company, wouldn't it?

A. Up to June 11th that is not true, because the price might have been advanced on June 11th, or June 30th, rather; the Code was amended effective on May 30th——

The Court: Let's stay out of the Code, gentlemen, and talk about prices as they exist.

A. It was amended effective June 11th, and in that particular amendment the prices were filed for the quarter.

Q. So that if a purchase of pipe were made as of today for an identified project, in an amount, or in a considerable

amount, as detailed in this letter, the chances would be likely that one of the mills would give a special price to the purchaser or would change their quoted price and allow the prices to remain in that way for the balance of the quarter?

A. No, I would not answer your question Yes in that way——

Q. Well, do you know?

A. The chances are not likely that would occur. There is a possibility but it is not likely; it is not a probability.

Q. Within the last few days, and to be specific: within the last week, haven't the prices on steel gone down?

A. In certain instances.

Q. Well, steel prices in general have gone down within the last week, have they not?

A. No, sir.

Q. In what instances have they gone down?

[fol. 3310] A. On bars, plates and shapes.

Q. That is reinforcing bars?

A. Well, merchant bars or reinforcing bars, and structural steel.

Q. How about the prices on steel pipe?

A. No change.

Q. Now about all you are able to say, just to sum up this exhibit here—what's the number of that?

A. No. 33.

Q. Just to sum that up, all you are able to say about Exhibit 33 is that there have been copied off of the price sheets the quoted prices, correctly, and incorporated into that exhibit?

A. I have analyzed this report and found the basis of calculation is correct.

Q. All right; that's all.

Mr. Griffith: Mr. Holloway, I will ask you if the pipe prices shown in Defendant's Exhibit 33 for large lot purchases apply to every other purchaser as well as Lone Star Gas Co?

A. That is correct.

Mr. Griffith: In other words, that is the rock bottom price for large lot purchases for every buyer?

A. That's right.

* * * * * * *

[fol. 3311] Mr. Griffith: Mr. Ed. C. Connor is recalled as a witness on rebuttal.

Ed. C. Connor, having been recalled as a witness for Defendant, testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. Mr. Connor, there has been some testimony here presented by witnesses for the State, or a witness for the State and the Railroad Commission to the effect that the business of the Lone Star Gas Company was quickly developed. Have you prepared any compilation showing the rate of development of the business of the company on major transportation lines?

A. I have.

Q. Will you produce it, please? (Witness produces copies of exhibit). Is this the compilation to which you refer?

A. It is.

Q. Being styled on the title cover, "Lone Star Gas Company. Historical Rate of Business Development, Major Transportation Lines"?

A. That is correct.

[fol. 3312] Mr. Griffith: We offer in evidence the compilation so identified by the witness. Are there any objections by counsel for the State?

(Thereupon the document above referred to was marked as Defendant's Exhibit 48.)

Q. Mr. Connor, in Defendant's Exhibit 48 have you shown a history of Line K, Line O to Lisbon, Texas, and Line L and L System, and Line E from Gainesville to Paris?

A. That is correct. The designation of the Line O to Lisbon refers to the section of Line O lying east of Lisbon.

. . . . . .

Q. Refer, please to the first page of Defendant's Exhibit 48. What have you shown in connection with the history of Line K?

A. I show the total deliveries by years in M. C. F. of gas transported through Line K.

Q. Commencing in the year 1920 and coming through the year 1931?

A. That is right.

[fol. 3313] Q. Why did you not carry it through the year 1933, Mr. Connor?

A. There would have been no substantial difference in the deliveries through Line K subsequent to the year 1931.

Q. In other words, by reference to the years 1927, 1928, 1929, 1930, and '31, as shown on this page, were the deliveries nearly the same for each of those years?

A. That is correct. Line O and Line K carry what is usually termed the base load of Lone Star Gas Company's system and their deliveries are more or less uniform from year to year.

Q. Now, it is noted that the deliveries through Line K were at their peak in the year 1925, and that the deliveries through the Line fell off in the next year. To what was that attributable?

A. The completion and placing in operation of Line O, which is an eighteen inch line parallel to Line K, which relieved Line O of the responsibility of carrying the entire deliveries of gas of the major transportation line.

Q. Don't you mean that Line O relieved Line K?

A. Line K, yes, that is what I intended to say.

Q. Now, commencing with the actual historical deliveries of gas through that Line, what does this first page indicate?

A. It indicates that Line K went through a period of very slow development with reference to the gas transported through it, beginning in the year 1920 and ending——

Q. Was that the year the Line was constructed?

[fol. 3314] A. That is correct; and ending during the year 1924.

Q. In other words, the business or the gas deliveries through that Line were not built up until a period of four years had elapsed from the date of the original construction?

A. Five years.

Q. Five years?

A. Yes, sir.

Q. Now, what is meant by KA delivery as shown in the second column of page 1 of Defendant's Exhibit 48?

A. Line K is the line which runs from the central West Texas area through Joshua Junction. In 1920 the Line extended only through Lipan. Deliveries at that time were wholly from production in the Mineral Wells district

through Line KA, and deliveries have been made into Line K from KA from that date. The line was subsequently extended, and deliveries were then made at Gordon, as well as at KA, and the division between the deliveries at KA and at Gordon merely indicates the points at which the gas was delivered into the Line K.

Q. Refer to the second page in Defendant's Exhibit 48, and also to the third page, Mr. Connor. What do you show on those pages?

A. I have shown the dates at which various towns on Line O east of Lisbon were attached,—in the first column indicating the town, in the second column the date at which [fol. 3315] the particular town was attached. The subsequent columns indicate the domestic and unaccounted for gas recorded in each town attached, by years. The consummation of those totals of sales is shown on page 3, and is expressed as a per cent of the maximum year, which was the year 1932.

Q. I did not get your answer, Mr. Connor.

A. I said that on page 3 there is shown a consummation of the domestic and unaccounted for sales in the individual towns, by years, together with the percentage indication of the ratio of the sales for each year to the sales of the maximum year, which occurred in the year 1932.

Q. Now, when was Line O constructed, or rather this portion of Line O?

A. It was put into operation in 1926.

Q. And for the first year what was the per cent of the total developed business which the line acquired?

A. 5.81.

Q. That was for the year 1926?

A. That is correct.

Q. In 1927 what percentage of the total business had the Line acquired?

A. 42.66 per cent.

Q. In 1928, what per cent?

A. 72.57 per cent.

Q. And giving the percentages for the several consecutive years following.

[fol. 3316] A. 1929, 86.91; 1930, 93.03; 1931, 94.42; 1932, 100 per cent.

Q. Now, what does that historical study indicate, Mr. Connor?

A. That historical study indicates the cumulative effect

of the rate of attachment of towns, the rate of attachment of customers, and the normal increase in consumer use, as reflected by the deliveries of a major transportation line.

Q. And your study extended over a six year period, did it not?

A. That is correct.

Q. Or rather, to be more exact, it includes seven years?

A. That is right,—including part of the year 1926.

Q. Refer next to the page styled, "Historical Idle Plant, L System, Annual Domestic Sales, Thousands of Cubic Feet", and to the page immediately following on which the L System is continued. What do you indicate on those pages?

A. I indicate the summation of that portion of the deliveries on the portion of the L System extending from Joshua Junction to the City of Waco, from the time that that portion of the Line L was constructed in 1920 through the year 1932. Now, in the preparation of this tabulation a slightly different method was pursued than that which was used in the preceding tabulation. The maximum year was determined by the maximum sales in each individual town on the System, without respect to the particular year in which the maximum sales of the individual towns occurred; and the *con*summation of the maximum sales in each individual town is shown to be 2,048,691,000 cubic feet. Of course, it would not be probable that there would be a coincidence of [fol. 3317] the maximum sales in any group of towns in any one year; therefore there would never have been a 100 per cent saturation on Line L, using that method as a basis; however, the percentage of the use of the Line, assuming 100 per cent to be when each town during the same year used its maximum amount of gas, is shown on the fifth page of the Exhibit.

[fol. 3318] Q. Mr. Connor, on the fifth page of the exhibit, where you show a total for the L System, do you show the rate of growth and attachment of the business as far as domestic sales were concerned for the entire L System by calendar years?

A. No; I dont. That portion of the line which is included in this study is the line from Joshua Junction to Waco, Texas.

Q. It is not the entire L System?

A. No; that would require a disintegration of the system into the individual branches, and a study of the individual

branches. This portion of the L System that I have included is common to all of the deliveries taken into the L System.

Q. What per cents do you show for the respective years for the total of maximum sales to each town served?

A. 3.7, 23.7, 27.7, 31.6, 35.2, 40.1, 43.5, 45.5, 65.02, 87.85, 95.08, 91.08, and 91.13.

Q. Now, that covers the years 1920 to 1932 in order, does it not?

A. That is correct.

Q. As you have stated the percentages?

A. That is correct; and the exhibit should be further explained by the fact that prior to the year 1927 the actual domestic sales of the City of Waco were not available.

Q. And you made an estimate of the volume of sales for [fol. 3319] the City of Waco for the calendar years 1920 to 1926, inclusive?

A. That is correct; and the method by which the estimate was made was extremely conservative, for the reason that we took the rate of growth in Waco for 1926 forward and projected it backward upon the same rate of growth. The rate of growth of such a city as Waco will slow up after gas has been introduced for a number of years.

Q. Will you refer, please, to the last page in the exhibit showing Line E from Gainesville to Paris, Texas. Now, in the first column have you set forth the towns that are served off Line E from Gainesville, Texas, to Paris, Texas?

A. I have.

Q. What does the second column headed "Date" indicate?

A. That indicates the year in which the particular sales —domestic sales, as indicated, were made.

Q. Does it indicate the date on which the sales of domestic gas were started in these various towns?

A. That is correct. In so far as the year 1925 is concerned, that is the first gas that was passed through the line. Each succeeding year indicates the attachment of certain towns, and the amount of gas which was sold for domestic purposes or unaccounted for in the individual distribution systems.

[fol. 3320] Q. You show a tabulation of the rate of growth and attachment of business, commencing with the year 1925, and ending with the year 1932?

A. That is correct. The study shows, however, that the maximum consumption was reached in the year 1930.

Q. That was a period——

A. That was a period of six years after deliveries were begun.

Q. In other words, it was not until the end of the sixth year that you had a complete saturation?

A. Five and a small portion of a year.

* * * * * * *

Q. Mr. Connor, have you examined Plaintiff's Exhibit 6, same purporting to be a reproduction cost new appraisal as of June 15, 1934, covering the Texas Gathering, Transmission, Compressing, and General Property of Lone Star Gas Company?

A. I have, yes, sir.

[fol. 3321] Q. In that exhibit, in connection with the determination of Taxes and Interest during Construction, do you understand that Mr. Freese adopted and applied any wholesale construction period?

* * * * * * *

[fol. 3322] Q. In his computation of Taxes During Construction, did Mr. Freese adopt a wholesale construction period, as reflected by his exhibit 6?

A. He did not.

Q. Mr. Connor, in connection with Defendant's Exhibit 28 did you adopt a definite wholesale construction period of time within which the property of the Company would be reconstructed or reproduced?

A. I did.

Q. Now, I am asking you, Mr. Connor, as an engineer, if a reproduction cost new appraisal necessarily presupposes the adoption of a fixed and definite wholesale construction period.

A. It is my opinion that that would be necessary in connection with making a reproduction cost estimate.

Q. And other than in the appraisal prepared by Mr. Freese or his firm, have you ever seen any reproduction cost appraisal which does not assume a fixed and definite wholesale construction period or time within which the property would be built?

[fol. 3323] A. I have not.

Q. What is the effect upon the computation of Taxes and Interest During Construction by failing to adopt a fixed

and definite period of time within which the property would be built?

A. It materially reduces the item of Interest During Construction, and practically eliminates the item of Taxes During Construction.

Q. Can you give an example—a simple example which will illustrate that point?

A. Yes. Take a property such as the distribution system of the Austin Gas Company.

The Court: What?

A. The Austin Gas Company. Property of that kind is built up historically by small increments, the amounts of which depend upon the current demand of customers for main extension and services. Those small increments can be built and completed within a very short period of time from the construction standpoint, and the amount of time involved in each increment which goes to make up the whole property would be such as to reduce the amount of interest on the property during construction to practically nothing, and to eliminate taxes during construction altogether. For instance, let us assume there are ten thousand services in the City of Austin—and by service I mean that portion of [fol. 3324] the main distribution system which takes the gas from the main pipe in the street to the customer's meter. Now, those services can be constructed in about half a day, or an hour each, and that is the way they are built historically; and so for the ten thousand services which would be required to deliver gas to the consumers in Austin, the construction period by the piecemeal method would be three or four hours. Now, on the wholesale reproduction program contemplating the reproduction of the property as a whole such a situation could not properly apply.

Q. Now, the illustration that you used for historical building up of the gas distribution system here at Austin might it be compared in a small way with a ten-story brick building, building it a brick at a time?

A. The analogy is somewhat comparable, yes.

Q. If Mr. Freese had adopted a wholesale construction period of two or three years for the reproduction of the property, what would have been the effect upon his allowance or estimate for Taxes or Interest During Construction?

A. They would have been materially increased, I believe, following his own method of computation.

Q. You have examined Plaintiffs' Exhibit 6, have you not, being Mr. Freese's appraisal?

A. Yes; I have.

[fol. 3325] Q. Have you noticed that the General Overhead and Undistributed Costs estimated by Mr. Freese, and determined and set forth in that exhibit, amount to approximately ten per cent of the Direct Structural Costs of the physical property?

A. That is correct; they do.

Q. In your judgment as an engineer, Mr. Connor, on wholesale construction would an allowance of approximately ten per cent for general overhead and undistributed costs be ample?

A. It would not; it would be utterly inadequate.

Q. Mr. Connor, is there any difference between historical Overhead socalled on costs built up by piecemeal construction, and Overhead Costs on wholesale construction, particularly where the piecemeal construction has been carried on by an organization which devotes part of its time to construction and the remainder to operation?

A. There is a substantial difference.

Q. What is that difference?

A. The difference is that the Overheads, if properly allocated, in the case of a property which has been built up over a long period of time, in connection with an operation of the property by a trained personnel, would result in Overhead charges substantially less than those which would be necessarily incurred in the reproduction of the property on a wholesale basis. The illustration which I gave in con-

[fol. 3326] nection with Interest and Taxes During Construction, relative to the piecemeal construction of the Austin Gas Company's property, would be equally applicable to the Legal, Administrative, and Other General Expenses, because the Austin Gas Company could extend a main one hundred feet today, and another main a hundred feet tomorrow, with no modification of its operating personnel, and the operating personnel could carry on that work along with their responsibilities; and such could not be the case if the property would be reproduced as of a given date.

* * * * * * *

[fol. 3327] Q. If a witness for the State has testified in this case, Mr. Connor, that his allowances for general and undistributed costs were determined in some measure by the actual general and undistributed costs capitalized on the books of the Lone Star Gas Company during certain years, would that, in your opinion as an engineer, be a criterion of the general and undistributed costs which would be incurred in a wholesale construction on a new project?

A. They would not.

Q. For what reason?

A. For the reason—and I feel that I have answered that question very largely in a previous answer; and that is, that the trained operating organization can absorb a substantial amount of construction responsibilities along with their other work, and to measure what would actually take place in a reproduction of a property, when the property was not operated, by that method, is an improper basis upon which to proceed.

Q. During recent years has the Lone Star Gas Company [fol. 3328] had a trained personnel which could efficiently construct large natural gas projects?

A. It has.

Q. And has utilization been made of that personnel?

A. And utilization has been made of that personnel.

Q. And was a great part of that personnel mainly engaged in operation of the Company, as well as construction of pipe line extensions and other projects?

A. That is correct.

Q. Mr. Connor, have you examined Plaintiffs' Exhibit 7, which is an estimate of annual depreciation allowances as of June 15, 1934, covering the Texas Gathering, Transmission, Compressing, and General Property of the Lone Star Gas Company?

A. I have, yes, sir.

Q. Now, the calculation of depreciation reserve accruals, as set forth in Plaintiffs' Exhibit 7, is upon the sinking fund method, is it not?

A. Very largely, yes; but not altogether so.

[fol. 3329] Q. What is the effect, Mr. Connor, of the use of the sinking fund method as applied to a natural gas property?

A. It is in a large measure to deprive the owners of the

property of the use and benefit of such accruals as are made in the reserve account.

Q. Is that due to the fact that the accruals in such accounts are not free capital?

A. That is correct.

Q. Is there any other reason?

A. No, that is sufficient, because that deprives the owners of the use of the accrual.

Q. Will you refer, please, Mr. Connor, to page two of Plaintiffs' Exhibit 7. In connection with certain property appearing on that page, does it appear that an amortization has been provided for over a thirteen year period?

A. That is correct.

Q. Is that true in relation to the Gathering System Rights-of-Way, Field Measuring Station Structures, Field Measuring Station Equipment, and Field Line Equipment?

A. That is correct. The amortization set out is not complete, however, but provides for what the witness determined to be the total loss or ultimate loss on abandonment.

Q. Does the adoption of that thirteen year period for amortization purposes presuppose a life of gas wells of thirteen years?

[fol. 3330] A. An average life of gas wells according to the testimony of the witness, because he predicated the life of well lines upon what he considered the average life of the gas wells.

* * * * * * *

[fol. 3331] Q. Mr. Connor, is there any factual basis for the assumption of the average life of gas wells and gas lines as thirteen years?

A. No, I don't think that there is, Mr. Griffith, and if the average life of gathering lines and the wells was thirteen years it would not have any particular bearing upon the rate of replacement.

Q. Why do you make that statement?

A. For the reason that in properties such as gas wells or pipe laid in the ground it is my opinion that the average [fol. 3332] life of those units of property is not a necessary factor which controls the rate of replacement of those units of property.

Q. In other words, are the replacements, abandonments, and removals of such pipe brought about in large measure by factors other than the average life of steel pipe?

A. That is correct—in a great measure caused by factors other than the average life of gas wells, as clearly indicated by the proportionate amounts of mortalities which have taken place in fields in which the average life of gas wells exceeds that of other wells.

Q. In what fields is that true—what has the history of the company or the experience of the company been in that connection?

A. By far the greatest number of replacements and abandonments has taken place in the Petrolia Field.

Q. And have those lines been replaced at a rate greatly in excess of the rates at which the wells have been abandoned?

A. Oh, yes. Well lines are removed for a great many other reasons.

Q. What are some of the reasons for which well lines are removed other than depreciation of the pipe?

A. Well, failure of a line; that is one of the causes, of course. Another cause is the necessary rearrangement which takes place in a system of well lines in any given field. Well lines become too small by reason of the decline in [fol. 3333] the pressure in an open field of the wells to which they are attached. It quite frequently becomes necessary to change from a high pressure connection to a low pressure connection. All those things affect the replacements and removals; they are not controlled by the life of the line.

Q. Will you refer to page eleven of Plaintiffs' Exhibit 7? Does the curve on that page indicate an average service life or service life for steel pipe of thirty-three and one-half years?

A. Thirty-three and a half years, I think is correct; yes.

Q. From any data or information which you have been able to assemble from any source, Mr. Connor, is there any factual basis for the assumption of thirty-three and one-half years as the service life of steel pipe?

A. No. As I said before about gas wells, if the average life of steel pipe were thirty-three years or fifty-three years or seventy-three years, it would not be a factor which would

necessarily control the natural rate of replacement of steel pipe.

Q. Because so many other factors bring about those changes and abandonments; is that correct?

A. No, because of the fundamental fact, and that is the failure of steel pipe due to a physical condition, is functional with the passage of time and the location in which the pipe is situated. When a replacement of pipe is made the replacement does not follow the average of the system, but follows the experience of the pipe that it replaces, be- [fol. 3334] cause it goes back into the same soil conditions that the pipe which has corroded was in.

Q. In other words, will the mortalities be greater in connection with the replacements than in connection with the original construction?

A. Yes, because the pipe replaced, as I said before, will not follow the average but will be controlled largely by the local conditions.

Q. Will you refer, please, to page twelve of Plaintiffs' Exhibit 7? For the calendar year 1931, or in the column right above the calendar year 1931, certain replacements are shown in connection with Lines J and C; is that correct?

A. That is correct.

Q. Are you familiar with thos- replacements of Lines J and C which were made in the year 1931?

A. I am, yes, sir.

Q. Were those replacements of a kind and character which will be experienced in the future by the company?

A. Oh, yes. However, in Exhibit 42 all the replacements for Line C were not included in the segregation of replacements due to the condition of the pipe, except such portion as was actually junked at the time of removal. Of course, all of Line J that was removed at that date was junked.

Q. Now, Mr. Connor, were there any removals in 1932 brought about for the same reasons that the removals were [fol. 3335] brought about in connection with Line J for the year 1931?

A. I think those removals, Mr. Griffith, were in 1933, and I think you refer to the replacements on Line L made necessary by internal corrosion of the pipe. There were practically no replacements of pipe in 1932.

Q. In 1933 did the company have replacements on Line J-2 similar or for causes or for reasons which were essen-

tially similar to the causes which brought about the removal of part of Line C in 1931?

A. That is correct.

Q. What brought about the removal and replacement of the pipe on Line J-2 in the year 1933?

A. The reconstruction of the highway between Dallas and Fort Worth.

Q. Well, can you indicate to the jury on Defendant's Exhibit 29, back of you, which is the pipe line map, and tell us where those replacements were made?

A. Here is the county line of Dallas County—from the City limits to the County line on J-2.

Q. Mr. Connor, have you attempted to make some analysis of the reserve accrual rates as set forth in Plaintiffs' Exhibit 7?

A. I have.

Q. In connection with those accrual rates is there any consideration given to excess cost of replacements over wholesale construction?

A. No, there is not.

[fol. 3336] Q. As a result of your experience and study, Mr. Connor, have you determined that the costs of replacements of steel pipe are in excess of the cost of wholesale construction in connection with the initial installation of pipe?

A. That is correct.

Q. To what extent, Mr. Connor?

A. Approximately 50 per cent.

Q. And have you made an analysis of the costs of such replacements covering a considerable volume of work?

A. I have, and I have testified concerning those costs.

Q. I believe you testified in that connection with your direct examination previously?

A. That is correct.

Q. Mr. Connor, if the public service plant and property of the company are to be depreciated by deducting the observed depreciation from the cost new of the property in this or in any other proceeding, would it be proper to apply the *the* sinking fund method as determined by Mr. Freese in connection with the depreciation reserve accruals as set forth in Plaintiffs' Exhibit 7?

A. It would not.

Q. For what reason?

A. Because you would be depriving the owners of the

property of the use of the money set aside for the purpose of offsetting the decline in per cent of new condition and [fol. 3337] would be deducting the loss due to decline in per cent in new condition.

Q. Mr. Connor, have you prepared an exhibit showing a comparison of the calculated mortalities of steel pipe as set forth in Plaintiffs' Exhibit 7 with the actual experience of the company—that is, the Lone Star Gas Company, in connection with such mortalities?

A. I have.

Q. Mr. Connor, is this the exhibit to which you refer, it being styled on the title cover "Lone Star Gas Company—Comparison of Historical Replacements, Removals and Abandonments, Main, Tap and Field Lines with Calculated Replacements, Removals and Abandonments"?

A. That is correct.

Mr. Griffith: We offer in evidence the exhibit so identified by the witness.

(Thereupon the document above referred to was marked as Defendant's Exhibit No. 49.)

Q. Mr. Connor, what have you set forth in the first page of Defendant's Exhibit 49?

A. All the results of certain calculations set out in detail on the subsequent pages, up to and including Table 4.

Q. Will you please explain the basis and method for the comparisons which you have made in Defendant's Exhibit 49—that is the comparison between the historical mortalities which the company has actually experienced in connection [fol. 3338] with steel pipe and the mortalities as calculated by Mr. Freese in Plaintiffs' Exhibit 7?

A. Perhaps it would be better to take the individual tables and make an explanation of them, and then refer to their application to the summary. In Table 1 there is an application of the replacement rates shown on page four of Plaintiffs' Exhibit 7 to the pipe in the system of Lone Star Gas Company which had reached the age indicated—in other words, pipe which had been in twenty-two years, which is the oldest complete service year—there has been applied a percentage determined by accumulating the replacement rates from one to and including twenty-two years shown on page four of Defendant's Exhibit 7.

[fol. 3339] Q. In what column on page 4 of Plaintiffs' Exhibit 7?

A. Column 2 of Plaintiffs' Exhibit 7. Now, Column A in Table One indicates the miles of equivalent three inch diameter pipe which were in service in the Lone Star Gas Company's system for various service years. There has been an adjustment made in the actual service life of Lines B and Line C, by reducing their service life two years an account of the fact that in 1917 the pipe in these two lines was taken out of the ground, thoroughly cleaned, rehabilitated and repainted from end to end and put back into the ground, and I have only allowed a reduction of two years to the service life of that pipe on account of that rehabilitation, and I think any calculation which did not take that into account would be misleading. I have also deducted from the footage of pipe in the system of Lone Star Gas Company that pipe which was acquired from The Texas Company in the year 1927. I make a separate and particular application of the necessary replacement rates to that pipe. I have also deducted the pipe which had been in service in prior years and which had been replaced, or at least it is not included in this particular table but it is given in another table. The cumulative replacement rates from Column 2, page 4 of Plaintiffs' Exhibit 7, when applied to the miles of pipe in service for the corresponding service year, gives the calculated replacements in miles of equivalent three inch pipe. Now, that is equivalent to this assumption: that at the beginning of the operations of Lone Star Gas Company [fol. 3340] the rates set out by Mr. Freese were put into effect, from the very beginning of the company's operation.

Q. In other words, you assumed the actual rates, or you applied the actual rates which Mr. Freese set forth in Plaintiffs' Exhibit 7?

A. That is correct. Assuming that the company started out and had decided that those rates were the correct rates to set up to provide for the replacement, removal and abandonment of steel pipe in the mains, the main lines and the tap lines, the calculated replacements which would be due primarily to the condition of the pipe would be 337.75 miles for twenty-two service years, taken from table 1. Now, table 2——

Q. That is on the third page in Defendant's Exhibit 49?

A. That is correct. Table 2 deals with a different mat-

ter, and that is the allowance made for the major removals in the fourth column of page 4 of Plaintiffs' Exhibit 7, which is set out to be .289 per cent per annum. Now, I have made an adjustment in that rate, because as I interpreted the adjustment of Mr. Freese, that he gave effect to a salvage, resulting in a loss of only about 74½ per cent—in other words, the entire property would not be lost. Therefore, the actual rate would be higher than the indicated rate in column 4 on page 4 of Exhibit 7, and that rate which I have used is not the rate shown in that column, of .289 per cent, but is .3882 per cent per annum. Now, I have applied this rate to all of the pipe which is in the system, including the pipe purchased from the Texas Company in 1927, as well as other pipe which had been removed prior to January 1, 1931, and [fol. 3341] have put back in the earliest year that pipe which I moved up two years on account of its rehabilitation.

Q. That is the pipe in Lines B and C?

A. Yes, for the reason that the removal of pipe might not be so materially affected by the fact that it had been repainted. So, applying then— Or, I have assumed now that each year of the company's history from the beginning, they set up this .3882 per cent to take care of removals—major removals and removals due to public requirements and changed operating conditions, and that results in a calculation of 320.83 miles of pipe removed, and that would be the number of feet of miles of pipe which would have been provided by the application of that annual accrual to the feet of pipe in service each year from the beginning of the company's operations.

On Table Three, I give effect to the pipe which was purchased from The Texas Company in 1927, to which I have just referred and which was excluded from the pipe in service on Table 1. Now, the reason that I made a separate study of this pipe was this: The pipe was older than pipe which might have been installed in 1927, but it was only in the plant of Lone Star Gas Company from 1927 forward. In other words, I gave effect to the age of the pipe as well as to the number of years that it was in the service of Lone Star Gas Company. Now, I went to the records of The Texas Company and ascertained when that pipe was actually installed—each line—and have given effect to that fact. [fol. 3342] For instance, some of the pipe was installed in 1912, and so I have assumed that the pipe, so far as Lone

Star Gas Company was concerned, was in service from the fifteenth to the 20th year of its life, inclusive, even though it was purchased by Lone Star Gas Company in 1927. Then, the cumulative replacement rates for those service years inclusive, taken from Column 2, page 4, Exhibit 7, are shown in Column B, table 3. Applying those rates to the miles of pipe, expressed in terms of three inch equivalent diameter, give the calculated replacements which would have taken place in that pipe, and the results are shown in Column C of table 3, Defendant's Exhibit 49.

* * * * * * *

A. Table 4 sets out the calculated mortalities or replacements which would have taken place in pipe which had been in service for a number of years but which was not in service as of January 1, 1933. In other words, I have given effect to pipe which was in service, and in which replacements might have been made while it was in service, but which is no longer in service, or has been removed from the main transmission system or the tap lines of the company. I have applied to that pipe, after ascertaining the date at which that pipe was originally installed, the proper annual replacement rates cumulative taken from Column 2, page 4, Plaintiffs' Exhibit 7. The calculated replacements, removals and abandonments as developed from Tables 1, 2, 3 and 4 are carried forward to page 1 of the Exhibit, and [fol. 3343] show that for the twenty-two year period following the first complete year of operation of Lone Star Gas Company, that the calculated replacements, removals and abandonments, or the accrual which would have resulted from the application of those accrual rates would have been equivalent to 685.47 miles of three inch equivalent diameter pipe, or expressed in feet of three inch equivalent diameter pipe, it would be 3,619,287 feet. Now, the actual replacements, removals and abandonments of steel pipe in the main lines and the tap lines of the Lone Star Gas Company for that twenty-two year period, was 5,854,744 feet, or in other words, had we proceeded from the very beginning and applied those rates for the specific purposes as set out on page 4 of Plaintiffs' Exhibit 7, we would have provided for only 61.8 per cent of the actual replacements, removals and abandonments which have taken place in the main lines and tap lines of the Lone Star Gas Company.

Q. And the calculations which are set out in Tables 1 to 5, inclusive, in Defendant's Exhibit 49, are carried forward to the summary on the first page of the Exhibit?

A. That is correct. Table 5 deals with the subject matter shown on page 6 of Plaintiffs' Exhibit 7, wherein it is set out that an annual rate of 2.77 per cent, when applied to the gathering lines of Lone Star Gas Company, would provide for all replacements, abandonments and removals, and would in addition create at the end of twenty years a credit balance of 76.98 per cent of the footage of pipe in service at that time.

* * * * * * *

[fol. 3344] A. In the case of the field lines, I have taken the footage of field lines which Lone Star Gas Company had from the first year that they have had a field line in service, and I have accumulated the additional footage by years, through the year 1932, and it so happens that the period of time from the time that the Lone Star Gas Company had its first installation of field lines, through the year 1932, is exactly twenty years; and which period corresponds to the period during which it is estimated in Plaintiffs' Exhibit 7 that the property would be amortized by means of the 2.77 per cent accrual rate.

I have applied the 2.77 per cent each year to the footage of pipe in service each year, as shown by table 5, but it so happens that beginning in 1920 the replacements, removals and abandonments of field lines became greater, substantially, than the 2.77 per cent accrual, and by the year 1922, instead of having a credit balance in the amortization fund, there would have been a substantial deficit, and at the year 1932, at the end of the twenty year period, instead of accruing an amortization fund representing some 76 per cent [fol. 3345] of the company's property in that particular property classification, there would have been an actual deficit in the reserve account.

Q. Now, the deficits concerning which you have testified are found in the column headed E, on table 5 of Defendant's Exhibit 49?

A. That is correct. If the company had started out in 1913 and set up this reserve accrual according to that plan, the company would have been without any credit balance in the reserve for the amortization of that property at the end

of the twenty years, but instead would have had more replacements than the accrual had provided for, and there would be an actual deficit in the reserve accrual.

* * * * * * *

Mr. Griffith:

Q. Mr. Connor, do you subscribe to the allocation of property as made by Mr. Hulcy in connection with Defendant's Exhibit 46?

A. I certainly do. I collaborated with Mr. Elmer Schmidt in the preparation of the report upon which that property allocation was based.

Q. And in your opinion is the allocation made upon the proper basis?

A. It is. It is the only method by which an accurate allocation could be made of the joint and/or concurrent use [fol. 3346] of property in the transportation of gas, transported wholly within the State of Texas, and gas transported from Oklahoma into the State of Texas.

Q. That's all.

* * * * * * *

[fol. 3347] P. M. Biddison, a witness for Defendant, recalled, resumed the stand and testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. Mr. Biddison, you testified in connection with your qualifications that you were familiar with the rate of development and attachment of the business of natural gas properties?

[fol. 3348] A. I did.

Q. And you do have such a familiarity?

A. I do.

Q. In your opinion, is there any such a thing as going value, going concern value, or cost of reproducing the business of a natural gas property?

A. Certainly there is.

Q. In your opinion, does Lone Star Gas Company have

going value or going concern value, and would it cost money to reproduce the business which the company actually has?

A. In my opinion, it has going concern value to a high degree, and I know that it costs money and takes time to develop business on a system such as the Lone Star Gas Company's system.

Q. Are you generally familiar with the cost of reproducing the business or determining going value or going concern value, as set out in Defendant's Exhibit 28, and as determined by Mr. Ed C. Connor?

A. I am.

Q. Do you subscribe to and approve the method used by Mr. Connor in estimating the cost of reproduction of the business?

A. I do, and I think an estimate of cost of reproduction of the business is a true measure of the amount of going concern value.

The Court: Just a moment—state that answer again; I did not hear it, Mr. Biddison.

A. I think the cost of developing the business is a true measure of going concern value.

The Court: Thank you sir; I didn't understand what you [fol. 3349] said the first time.

Q. In connection with your own experience, in connection with natural gas properties, have you had occasion to observe the historical growth of the business of those natural gas properties, Mr. Biddison?

A. I have, and I had occasion to do so in connection with the properties of the Lone Star Gas Company.

Q. When was that, Mr. Biddison?

A. During the period from 1914 to 1919, during which period I acted as consulting engineer to the Lone Star Gas Company.

Q. And was the rate of attachment of the business of Lone Star Gas Company gradual over those years?

A. It was.

Q. The Lone Star Gas Company started out in business in the years 1909 and 1910, did it not?

A. That is correct.

Q. The principal markets of the company at the inception of the construction of the company's pipe lines were Fort Worth and Dallas, were they not?

A. That is correct.

Q. Was all of the business in Fort Worth and Dallas immediately acquired upon the construction of the company's pipe line facilities and the delivery of gas at the city gates of Fort Worth and Dallas?

A. It certainly was not.

Q. Did it take time and money in which to acquire that business?

[fol. 3350] A. It took time and money, and during the period during which this business was being acquired in Fort Worth and Dallas, there were facilities of the company not used to capacity, which had to be constructed in advance of full capacity use on which fixed charges ran.

Q. And is that the reason why you believe that the fixed charges on idle plant may in some measure constitute a yardstick for the determination of the cost of reproduction of the business of the company.

A. Yes.

Q. In connection with your experience with other natural gas properties, have you observed, Mr. Biddison, that invariably the business of the company, even when all direct structural costs have been incurred, and the plant is completed and operable, that the business is not immediately attached?

A. I have so observed it, and that rate at which business can be attached is somewhat dependent upon the size of the community and also somewhat dependent upon whether or not the community has previously had manufactured gas service.

Q. Would you say that it is the invariable rule, Mr. Biddison, that it takes a number of years for any natural gas property to acquire full development of its business, both with respect to customer use of gas and customer saturation?

A. Yes.

Q. Mr. Biddison, have you examined Plaintiffs' Exhibit 6?

* * * * * * *

[fol. 3351] A. I have.

Q. What is the effect of the deductions by Mr. Freese in Plaintiffs' Exhibit 6, on the excavation costs as determined by you for the same properties, and as evaluated in Defendant's Exhibit No. 28?

A. In Exhibit 28 we evaluated the total public service properties. Plaintiffs' Exhibit No. 6 evaluated only a portion of them. The net result in making the correction which Mr. Freese has attempted, is to produce figures for the construction of the lines shown in his exhibit, far below what I think it is possible to construct those lines for.

Q. Is that true in connection with his excavation costs?

A. It is.

Q. I believe that Mr. Steinberger testified, this morning, that the total amount of Mr. Freese's deductions covering excavation costs, approximated $550,000.00; is that correct?

A. I have not checked it myself as to his Exhibit 6, but I have checked the application of his costs against the Lone Star Gas Company's system in its entirety.

[fol. 3352] Q. And what is the result of that check?

A. The result of that check is to decrease the construction costs on excavation in the amount of over $588,000.00.

Q. That would be covering only the property which Mr. Freese evaluated in connection with Plaintiffs' Exhibit 7, or 6?

A. No; that is comparing the prices used by Mr. Freese in his Exhibit 6, to the excavation required on the Transmission System shown in Exhibit 28.

Q. You are referring to Defendant's Exhibit 28?

A. Yes, sir.

Q. Now, Mr. Biddison, if Mr. Freese—you understand that Mr. Freese adopted all of your construction costs except excavation costs?

A. Yes, sir.

Q. And that Plaintiffs' Exhibit 6 so shows?

A. Yes, sir, with this exception, that there was a slight modification of hauling costs. That was a comparatively small modification.

Q. That would not amount to many thousands of dollars?

A. No, it would not.

Q. Now, if it connection with the preparation of Plaintiffs' Exhibit 6 Mr. Freese actually used large lot prices for pipe, current as of June 15, 1934, what would be the [fol. 3353] effect upon the painting, laying and testing costs, and other costs included in pipe line construction?

A. I have not analyzed that for all lines.

Q. Have you analyzed it for a portion of the pipe lines or the transmission line equipment evaluated by Mr. Freese in Plaintiffs' Exhibit 6?

A. I have; I have picked some lines that I consider to be representative lines, to show the effect of that assumption. Consider, for example, 18-inch dresser pipe in Line A, pipe weighing 59.032 pounds per lineal foot, which is estimated in our Exhibit 28 to cost $303.9440 per foot (per 100 lineal feet)* installed. This is based on a pipe price, f.o.b. Texas common points, including mill inspection as of January 1, 1934, of $237.8443 per 100 lineal feet.

* * * * * * *

[fol. 3354] A. This is further based upon a total cost for installation, including all contingencies, of $66.0997 per 100 lineal feet. Now, this figure may be arrived at by deducting the pipe price which I have quoted, f.o.b. Texas common points, from the cost per 100 lineal feet, installed, which I quoted. Now, if the pipe price be assumed to be that of June 11, 1934——

Q. That is the same price which existed on June 15, 1934, did it not, the date as of which Mr. Freese prepared Exhibit 6?

A. It is; and we deduct that figure from the $303.9440, this pipe price being $248.4086, we have left for installation, including all contingencies, $55.4634 per 100 lineal feet. Now, this is the amount of money which would be available for that construction work in our Exhibit 28, if we attempt to include in that pipe prices as of to-day. Now, of that $55.4634 per 100 lineal feet, our estimate for [fol. 3355] the trench cost in Exhibit 28, is $26.3838, which allows, when deducted from the $55.4634 only $29.0796 per 100 lineal feet. If we add to this last figure the cost of trenching based upon the units costs assumed by Mr. Freese we have a cost for trenching of $23.4026 per 100 lineal feet, which produces a total installation cost, based upon Mr. Freese's cost for trenching work and upon the prices of pipe as of to-day, of $52.4822, or 52½ cents per lineal foot for the installation charge on 18-inch dresser couplered line; and 18-inch dresser couplered line cannot be laid for any such price. I understood Mr. Freese's testimony to be that he believed the allowances for omissions and contingencies used in our Exhibit 28 would offset the differences in pipe prices. In this particular instance the difference in pipe prices is $10.6363 per 100 lineal feet, while the allowance for contingencies as used in Exhibit 28 is

$7.4133 per 100 lineal feet. If we consider, further, 18-inch 53.223 pound dresser couplered pipe in this same Line A, we arrive at an installation cost of $45.3181 per 100 lineal feet for that dresser couplered pipe, based upon Mr. Freese's unit costs for trenching, and based upon the assumption that the over-all cost as used in our Exhibit 28 would allow for present day pipe prices, and in that case [fol. 3356] the increase in pipe prices between January 1, 1933 and as of to-day amounts to $16.2790 per 100 lineal feet, while the allowance for omissions and contingencies is $6.8057 per 100 lineal feet. Now, in Mr. Freese's testimony the other day in regard to this 59 pound pipe, I am under the impression that he quoted an improper figure as to the present-day price of this pipe.

Q. You mean that he inadvertently quoted an improper figure?

A. Yes, my recollection was that he quoted a figure of $2.66, substantially, as the present-day price of this pipe. I don't know what the discrepancy was due to. So this figure which I have used, and which I have checked, will not agree with the citation which Mr. Freese gave in his own testimony. Now, analyzing a number of lines in that manner, I find on Line B 16-inch that the difference in pipe prices is a trifle over $9.30 per 100 lineal feet, while the allowance for omissions and contingencies is a trifle over $5.55 per 100 lineal feet.

* * * * * * *

[fol. 3357] A. If I had used the figure quoted by Mr. Freese I would have had a much greater divergence than I have shown here, because the figure quoted by him is, I believe, some 17-½ or 18 cents per foot in excess of the pipe which I have here. Taking a 12-inch line, 33.37 pounds——

Q. Per foot.

A. Per foot, Line GA, on which in Exhibit 28 our total installation costs, including contingencies, are estimated to be $43.55 per 100 lineal feet; if we assume that our over-all cost per 100 lineal feet of $170.8419 would include pipe prices as of to-day, and if we corrected our trenching costs to the unit figures adopted by Mr. Freese, we would have available for the construction of that line only $32.6455 per 100 lineal feet, or a trifle over 32 cents per foot.

Q. Can 12-inch pipe be laid for that figure, Mr. Biddison?

A. It can not. On this particular pipe the difference [fol. 3358] — prices between January 1, 1934, and as of to-day, is——

Q. January 1, 1933?

A. 1933, and as of to-day, is per 100 lineal feet $7.3759; whereas, the contingencies allowed for in Exhibit 28 on this line amount to $4.1669 per 100 lineal feet. I have a number of other lines set up in the same manner. On Line O, 18-inch 53.223 pound pipe, the difference in pipe prices——

Q. As between January 1, 1933, and June 15, 1934?

A. Yes, is $16.2790 per 100 lineal feet, while the allowance for omissions and contingencies on that line, as estimated in our Exhibit 28, is $7.6589 per 100 lineal feet. In general, this per cent shows that the assumption that the unit prices per foot of pipe in place in Exhibit 28 would include prices as of to-day, wipes out our allowance for omissions and contingencies in general in a ratio of nearly two to one, and when you further consider the unit costs for trenching work proposed by Mr. Freese and apply them to the estimates in Exhibit 28, the resultant figures for installation cost are far below those for which pipe lines of this nature can be or have been installed in the last ten or twelve years.

Q. Mr. Biddison, what weighted cost per cubic yard was used in Defendant's Exhibit 28 for machine excavation?

[fol. 3359] A. The weighted cost per cubic yard from Exhibit 28 for machine trenching is $.4843 per cubic yard, or a little less than 49½ cents per cubic yard for machine trenching.

Q. Now, does all machine trenching cost the same, regardless of the size of the trench, Mr. Biddison?

A. It does not.

Q. Is there a wide variance in cost as between the excavation on a trench for 4-inch pipe and the excavation on a trench for 18-inch pipe or 20-inch pipe?

A. Yes, there is.

Q. I mean per cubic yard.

A. Yes, there is.

Q. Now, what is that variation, and what is the reason for it?

A. The reason for it is that in machine trenching work you are limited to a top speed on the machine, in any event,

beyond which you can not go. If you have a trench of large area your machine will not travel at the top speed, but you will dig with it more cubic yards per day than you will when digging a small sized trench, and on the larger sized trenches your output per machine per day is greater than it is when you are digging smaller trenches.

Q. For what reason did you apply a varying cost per [fol. 3360] cubic yard of excavation, depending upon the size of the trench?

A. Yes, that is correct.

Q. In connection with your estimates as set forth in Defendant's Exhibit 28.

A. That is correct. I might cite some of those variations. On the A System for 18-inch pipe machine trenching is at as low as $.407.

Q. Per cubic yard?

A. Per cubic yard.

* * * * * * *

[fols. 3361-3366] Q. Go ahead, Mr. Biddison.

A. While on Line A-1-4, three-inch line, it is $.521 per cubic yard; on Line A, 18-inch, in Oklahoma, it is $.40 per cubic yard; on Line A-D, 6-inch, it is $.612 per cubic yard.

Q. So you have endeavored to make an individual application of costs to the specific size of trench to be excavated?

A. That is correct.

Q. Depending upon the width and depth of the trench?

A. That is correct; and that results in a different figure per cubic yard for trench excavation, for not quite every line, but nearly every line, and certainly a different figure for the average for trench excavation by machine on every system of lines.

* * * * * * *

[fol. 3367] Q. In your own experience as a construction engineer on natural gas pipe lines have you ever heard of natural gas pipe line construction or trench excavation being carried on in accordance with any such specifications as were outlined by Mr. Nichols?

A. I have not.

Q. Mr. Biddison, have you examined Plaintiffs' Exhibit 6?

A. I have.

Q. Have you noted that in Plaintiffs' Exhibit 6 Mr. Freese has allowed for general and undistributed costs a sum which approximates ten per cent of his direct structural costs of physical property?

A. Yes; I noted that.

Q. Mr. Biddison, in any reproduction cost appraisal, other than that appraisal made by Mr. Freese or his firm, have you ever observed a failure to compute Taxes and Interest During Construction based upon a fixed or definite wholesale construction period or time within which the property would be reproduced or constructed?

A. No; and I don't see how an estimate of cost of reproduction, or an original estimate for construction of a property of any size, can be made and proper consideration given to those items without the predetermination of a fixed period for the construction of the property.

[fol. 3368] Q. What is the effect of the failure, as reflected by Plaintiffs' Exhibit 6, to assume a fixed period of time in which the property would be reproduced, in so far as the computation of taxes and interest during construction are concerned?

A. The effect of that failure is to practically eliminate taxes during construction which would be incurred during reproduction, and to reduce the estimate of interest during construction which would actually be incurred during the wholesale construction period to a figure far below what I think would actually be incurred.

Q. Mr. Biddison, have you participated as a consulting engineer in the construction of many hundreds or thousands of miles of transmission line equipment?

A. I have.

Q. And other natural gas properties of practically every kind and description?

A. Yes.

Q. In connection with the major construction projects which have been constructed under your supervision, as a part of a wholesale construction program, what have been the actual overhead and general undistributed costs?

A. Well, in the case of Southern Natural Gas Corporation, they were in excess of 18 per cent.

Q. As contrasted with Mr. Freese's estimate of ap-
[fol. 3369] proximately ten per cent as shown in Plaintiffs' Exhibit 6.

A. That is correct. On the Southern Gas & Fuel Company, which was a small job, those costs ran in excess of 20 per cent.

Q. What was the Southern Natural Gas projects, and the Southern Gas & Fuel project?

A. The Southern Natural Gas project involved a transmission system from the Northern Louisiana fields across Mississippi and Alabama into Georgia. The Southern Gas & Fuel job embraced an 18-inch line from Baton Rouge to New Orleans, Louisiana.

Q. Were both of those major construction projects?

A. They were.

Q. And the actual historical general and undistributed overhead costs were in the per cent relation which you have mentioned?

A. That is correct.

Q. And the percentages which you mentioned are expressed in connection with the direct structural costs of the physical property?

A. Yes; the percentages which I have stated are the percentages of direct structural costs, which were incurred as general and undistributed costs.

Q. Mr. Biddison, have you examined Plaintiffs' Exhibit 7, being an estimate of annual depreciation reserve ac-
[fol. 3370] cruals, as determined by Mr. S. W. Freese?

A. I have.

Q. Have you noted that Mr. Freese has used a 13-year figure for amortization of gathering lines?

A. Yes.

Q. Is there any factual basis, in your judgment, for the adoption of a thirteen-year figure for the amortization of gathering lines?

A. I don't know of any facts that would justify it, and I don't know where any such facts might possibly be obtained.

Q. Why do you make that statement, Mr. Biddison?

A. Well, I just never heard in all my experience of any relationship of gathering lines, or well lines, or gas wells, or any other such equipment to any such figure of life.

Q. Are there many factors which make for the removal, replacement and abandonment of gathering lines which

have nothing whatever to do with the deterioration of pipe?

A. That is correct; and further than that, even if the average life of pipe were known in any locality, that average life figure does not govern the rate of replacements.

[fol. 3371] Q. Why is that true, Mr. Biddison?

A. Because the thing that governs the rate of replacements due to physical deterioration is not so much the average life as it is the variations of the specific items from the average, and that can be demonstrated mathematically, and has been so done.

Q. And can you do it?

A. I can and have done so.

[fol. 3372] Q. Mr. Biddison, will you examine, please, page 11 of Plaintiff's Exhibit 7? Does that page purport to be a mortality table covering the life of steel pipe?

A. It does.

Q. Does it purport to show that the service life of steel pipe is thirty-three and a half years?

A. It so states.

Q. Now, Mr. Biddison, you have been in the natural gas business a great many years. From any information which you have been able to obtain or any data that you ever heard of, have you ever been able to determine that the average life of steel pipe is as long as thirty-three and a half years?

A. No, and nobody will be able to ascertain what the average life of steel pipe is in any locality for a great many years yet to come, because steel pipe has not been manufactured long enough for anybody to know in any specific location what its average life is.

Q. Based upon all presently known data, do you believe that the average life of steel pipe is more or less than thirty-three and a half years?

* * * * * * *

[fol. 3373] A. Well, I don't believe it is more, and I don't believe it is less. I just don't believe there is any such relationship existing.

Q. Why do you make that statement, Mr. Biddison?

A. Because steel pipe has not been manufactured long enough so that in any particular locality its average life can have been determined.

Q. You mean that steel pipe has not gone through a life cycle in any particular locality?

A. That is correct. The first piece of steel pipe that has been made is not as old as I am.

Q. Mr. Biddison, in connection with Plaintiffs' Exhibit 7, Mr. Freese made no provision in connection with his reserve accrual rates, as I interpret the exhibit, for any excess cost of replacements over original construction?

A. I can't find any such allowance in this exhibit.

Q. If such is correct, and no allowance was made for excess cost of replacements over original construction, would the reserve accrual rate as determined by Mr. Freese and set forth in Plaintiffs' Exhibit 7 be inadequate or otherwise?

A. If the reserve set forth by Mr. Freese was otherwise adequate, still, by virtue of the fact that there is no allow-
[fol. 3374] ance to take care of the excess cost of replacements over original construction, it is still inadequate for that reason.

Q. Is there an excess cost for the replacement of steel pipe joint by joint over the wholesale cost incurred on original construction?

A. Yes, a very substantial excess.

Q. And what is the reason for that excess cost of replacements over the cost of original construction?

A. Well, the amount of time of a crew required to make a small installation, their moving in and out, is one contributing factor to the excess cost. The excess time required in disconnecting and reconnecting the joints is another reason for it; the excess cost of ditching work over installed pipe is compared to ditching work before the pipe has been laid is another reason for it. Almost every operation in the making of a replacement takes more time and costs more money than it does in wholesale construction work.

Q. As an example, Mr. Biddison, would it cost more to replace a joist or a sill in a house than it would to put that joist or sill in at the time of original construction?

A. Certainly it would, and it would cost more money also to send a crew out to put in six joists than it would to have a crew working there long enough to put in several hundred.

Q. Mr. Biddison, are you generally familiar with the allocation of property as made by Mr. D. A. Hulcy in Defendant's Exhibit 46?

[fol. 3375] A. Generally so, yes, sir.

Q. Do you have such familiarity as would enable you to testify as to whether the allocation he made is reasonable or otherwise?

A. Yes.

Q. Do you believe it to be reasonable?

A. I believe it to be reasonable, and I do not believe that any other basis of allocation would approach it in equity.

Q. In connection with your work, Mr. Biddison, have you had occasion to assist in negotiations for the financing of construction of natural gas projects, including natural gas pipe line enterprises similar in all essential respects to the business of Lone Star Gas Company?

A. I have, several times.

Q. Are you familiar with the rates of return and current yields of securities such as mortgage bonds of gas pipe line companies doing business in the United States?

A. Generally so. I have made no specific recent studies on it; I am generally familiar with what has been going on with reference to natural gas securities.

Q. Is the natural gas business considered speculative and hazardous or not?

A. It is, as compared to other utility enterprises.

* * * * * * *

[fol. 3376] Q. Mr. Biddison, based upon your experience, what minimum net annual rate of return do you believe the Lone Star Gas Company is entitled to receive on the fair value of its public service property?

A. Ten per cent net after depreciation accruals.

Q. And as you use the term "depreciation", is that inclusive of depletion as well as amortization?

A. It is. I refer to the general accrual fund commonly styled depreciation accrual fund.

Q. And is that ten per cent net after all other operating expenses have been properly provided for?

A. It is.

Cross-examination.

Questions by Mr. Fitzhugh:

Q. And before payment of Federal income taxes, or after payment?

[fol. 3377] A. After payment of Federal income taxes, ten per cent net.

Q. That is the very minimum, isn't it?

A. Yes, I think so.

Q. What is your maximum?

A. Well, my maximum, I would say, would be twelve and a half to fifteen per cent.

Q. Twelve and a half to fifteen per cent?

A. Yes, sir.

Q. Didn't you testify in the Laredo rate case here a while back that it ought to be twenty per cent for any public utility as a maximum?

A. No.

Q. You set a minimum of ten and a maximum of twenty, did you not, in that case?

A. I think no. I did state a minimum of ten net.

Q. Now you say a maximum of twelve and a half to fifteen?

A. Yes, sir.

Q. Did you make up your mind on it?

A. I made up my mind twelve and a half to fifteen.

Q. Fifteen would be your maximum, then?

A. That was the highest.

Q. I thought it was one of those "and/or" propositions.

A. No.

Q. Now, Mr. Biddison, when you first started out you were talking about pipe prices, and you read, if I under-[fol. 3378] stood you correctly, what the net figures would be, taking into consideration the rises in pipe prices on certain lines; is that what you did?

A. No.

Q. For certain sizes?

A. Not if I understood your question correctly. I read into the record what would be left available for construction costs if we assume that the installed price per hundred lineal feet which has been used in Exhibit 28 were assumed to include present day prices of pipe—to allow present day prices of pipe.

Q. And you singled out certain sizes, did you not?

A. Yes, sir.

Q. Now, have you calculated what would be the difference as applied to all the property included—I am talking about pipe now—in the Plaintiffs' Exhibit No. 6?

A. No; I have had no opportunity to do it. That is too long a job for the time that has been available.

Q. Well, what is the omissions and contingencies applied to all the property included in and covered by Plaintiffs' Exhibit No. 6?

A. I don't know.

Q. As allowed by yourself?

A. I don't know. I made no determination of it.

Q. For the same property. You could not tell that?

A. I have made no determination of it.

[fol. 3379] Q. So you don't know whether the omissions and contingencies would cover the rise in pipe prices or not, do you, as applied to Plaintiffs' Exhibit No. 6?

A. Well, I have a whole page of lines which I picked out, and it does not approach doing it on any of the lines I picked out.

Q. Well, you didn't take the whole exhibit?

A. No, but I have taken pipe from four and a half inch up to 18 inch.

Q. Now, what was the rise in pipe prices, the total amount, covered by that item and applied to your Exhibit 28, which includes the whole property?

A. Well, I don't know offhand. I believe Mr. Steinberger testified to that point.

Q. Do you know what the approximate figure was?

A. No; I have forgotten it now. His exhibit would show.

Q. Do you have Mr. Steinberger's exhibit before you now?

A. Yes.

Q. Can you tell from that what the amount for the rise in pipe prices would be?

A. This is not the exhibit that shows that difference.

Q. Well, in round figures, I think he testified that the difference in pipe prices would be about a million two hundred thousand dollars at one time, and deducting a decrease in pipe prices of about three hundred thousand dollars would leave net around nine hundred thousand. Did you actually check it in any way?

[fol. 3380] A. I could if I could get his testimony or his exhibit. I don't remember which exhibit it was that he had nor what page it was. I don't have it now.

Q. Well, can you tell what the contingencies would be in your whole appraisal?

A. I have made no computation of that in the whole appraisal.

Q. Well, now, without knowing any of those things, Mr. Biddison, how in the world could you say that the item of

omissions and contingencies applied over all to Mr. Freese's Exhibit 6 would not equal any change in pipe prices?

A. Just by the method I have exemplified in citing these lines.

Q. Picking out a few lines?

A. Yes, precisely—not a few, but a large number.

Q. Now, there has been some testimony from various witnesses about bell holes in connection with the excavation and laying of pipe lines. Are the bell holes ever dug on twelve inch or smaller pipe?

A. Yes, certainly.

Q. Can't pipe of this size be tied in on the top of the ditch before the pipe is dropped into the ditch just as well as it could if the pipe were already settled in the ditch and the tie-in made?

A. When you are laying dresser coupled pipe that is the way you always do it, and when you are laying welded pipe [fol. 3381] that is the way you apply it, but you have some that have to be made down in the hole. I think probably you have a misunderstanding of the bell holes here in connection with dresser coupled pipe. I will read the specifications from a contract for laying dresser coupled pipe, which will exemplify it.

[fol. 3382] Q. Well, I don't care about any contract. I want to know how it is done.

A. Well, it is done after the pipe is over the ditch, by a man getting down in the ditch and shoveling out sufficient dirt so that the dresser coupler may set down in the hole and the pipe rest on the bottom of the ditch and so that the pipe will be supported by itself, instead of being supported by the dresser coupler.

Q. Now, you are talking about dresser coupled pipe, aren't you?

A. Yes.

Q. Now, the original question was as to welded lines.

A. You didn't so state.

Q. Then I intended to do so. How often do you have a bell hole for welds, on a twelve inch welded pipe line, for tying in?

A. On an average of about every 100 feet.

Q. Is it your testimony that those tying in welds can not be made on the top of the ditch before the pipe is dropped into the ditch?

A. No, you could block that pipe up high enough so that you could make the welds at the tie-ins without digging the bell holes, but that is not the actual practice, and would not be economical. In actual practice, you actually cut out bell holes where the tie-ins come.

Q. On small pipe, such as three inch, four inch and six inch pipe, don't you always have the pipe up on skids, and aren't the welds made on the pipe right up on the skids?

[fol. 3383] A. Yes, and also on larger size pipe, right on up the line, but there is a necessity for the bell holes at the tie-ins, so that a man can work around that pipe in making the welds.

Q. If the tie-in is made up on the skid before the pipe is dropped into the ditch, how could there ever be any necessity for a bell hole?

A. So that a man could have clearance around that pipe to work, and they do dig them in practice.

Q. You mean while he is making the weld on the pipe, up on the skids?

A. Yes.

Q. And that is your testimony?

A. Absolutely, and that testimony is based on having supervised a lot of that very kind of work.

Q. Well now, if you are correct in that, Mr. Biddison—or, how high is this pipe on the skids?

A. Well, those skids are ordinarily four by fours, and on big pipe they may be four by sixes.

Q. How high up from the ditch are the skids?

A. The skids lay right on the ground.

Q. Right along the top of the ditch, is that correct?

A. Yes.

Q. Now, if you are correct about that, all that would have to be done to allow a man to work around that pipe which is laying up along even with the top of the ditch would be to knock off about a foot of the ditch to give him all the [fol. 3384] room he would need to work around the pipe; isn't that right?

A. About a foot of the ditch is about right, yes.

Q. Well now, that is not really a bell hole, is it?

A. It is called a bell hole, yes.

Q. That is not a bell hole in the sense that you use one where you have dresser coupled pipe?

A. No, sir.

Q. Where the bell hole goes clear down the whole depth of the ditch?

A. No, in the case of the dresser coupled pipe, it is a hole dug in the bottom of the ditch only, and you don't shave off the sides of the ditch.

Q. What gang is used for the digging of those bell holes?

A. A crew for the digging of the bell holes.

Q. You have a separate gang for that work?

A. Yes, generally.

Q. And if they are working in connection with dresser coupled pipe, they work in connection with the laying gang?

A. Yes.

Q. And right along with them?

A. Yes, when they are working in connection with the welding gang in a welded line, they work with the welding gang, or the laying gang, and if it is in connection with dresser coupled pipe it is in connection with the laying gang.

Q. Is pipe ordinarily strung along ahead of the ditcher or behind the ditcher?

[fol. 3385] A. It depends upon the class of pipe you are laying.

Q. In the case of a welded line?

A. In the case of welded lines, it is usually strung ahead of the ditcher.

Q. How about in the case of the dresser coupled line?

A. In the case of a dresser coupled line, it may be done either way, so far as the stringing is concerned.

Q. Now, why the difference?

A. In the case of welded lines, it is advantageous to have your welding done ahead of the ditching. There is more room to work in and your right of way is not obstructed by open trench.

Q. And in the case of the dresser coupled lines, it doesn't make any difference?

A. It does not make so much difference; in the case of dresser coupled lines, it is of course advantageous to have your pipe on hand, and know it will be there when you get your ditch dug, and therefore it may be strung ahead of the ditching machine. It is not, however, ordinarily laid ahead of the ditching machine.

Q. Now, when you say you never heard of any excavation specifications of the sort given by Mr. Nichols to these

excavation contractors, do you mean to say that there is no such a thing as contracting with contractors for work of this sort?

A. No, I don't mean that at all.

Q. Then you do sometimes contract that work, do you not?

A. Well, I assume some of it has been contracted as a [fol. 3386] separate contract, but I never knew of it being done.

Q. Now, what sort of specifications do you give when you contract work of that sort? You have a contract there, don't you, Mr. Biddison?

A. Yes, right here.

Q. And it has some specifications for excavation in it, does it not?

A. Yes.

Q. Will you read those?

A. Yes. "Ditches shall be machine dug whenever possible and economical so to dig. The trench shall be excavated to a width not less than seven (7) inches wider than the outside diameter of the pipe.

"Except where special conditions as described below are encountered, the depth of ditch shall be thirty (30) inches greater than the diameter of the pipe. This shall be the normal depth and shall be the minimum for all parts of the work except that where the entire ditch is in rock or the material is unusually heavy and not subject to softening by water, the engineers may permit and approve a depth not less than 24 inches greater than the diameter of the pipe but in such cases, the engineers' approval must be obtained before completing the ditch. Where the soil is soft, the engineers may require a depth of ditch of 66 inches and in special cases, such as through the shoulders of the banks in the approaches to streams, when single line is laid, the engineers may require the depth of the ditch to [fol. 3387] be 96 inches. No adjustment of compensation will be made on account of the changes in the depth described herein. When the depth of the ditch is more than 96 inches, additional compensation will be paid the contractor for the extra work as herein provided, but contractor shall, before beginning the extra work, obtain a written order from the engineers covering each case where extra depth is authorized.

"Ditch shall be carefully graded by hand wherever considered necessary by the engineers. All pipe shall rest on the bottom of the ditch. Bell holes shall be dug for all couplings so that the pipe weight will not be carried on the couplings except that in locations to be determined by the engineers, sufficient crumbs of dirt may be left in the bottom of the ditch to form a bed for the pipe in which case the depth of the ditch will be measured to loose earth in bottom of ditch and not to actual ditch bottom and in which case, bell holes will not be required."

• • • "In all rock excavation, couplings shall be bell holed or sufficient crumbs of earth be left in the bottom of the ditch to provide a uniform bed for the pipe.

"All curves or bends in ditching shall be made easy so as not to require firebending of pipe except where special conditions make sharp bends necessary and unavoidable." [fol. 3388] Now, that is a ditching clause from a contract embracing the complete operation of unloading, hauling, stringing, ditching, laying, painting, backfilling and cleaning up right of way.

Q. All right, then.

A. And that is the usual form in which ditching contracts will be found in connection with the other operations for laying of pipe.

Q. Now those specifications in general show the depth of trench, the condition that the ditch is to be delivered in and the width of the trench and provisions as to what the contractor's obligation is in different kinds of soil conditions; is that right?

A. They do.

Q. Now, isn't that just about what Mr. Nichols did in his specifications? He specifies the trench size, the kind of ditches to be delivered, and the obligations of the contractor in digging it, didn't he?

A. He did those things, but there are certain other essential elements that are mentioned in here which he did not include, and there is an essential difference in the requisite form of contract for submission as a separate ditching contract from that required for the ditching specifications in an over-all contract, and those differences were not allowed for in the specifications delivered or submitted in this

2021

hearing as having been given to the ditching contractors by Mr. Freese.

* * * * * * *

[fol. 3389] Mr. Fitzhugh:

Q. Of course you don't mean to say, Mr. Biddison, that specifications are not different, and are not differently handled in each contract?

[fol. 3390] A. Do you mean as between these two contracts here to which I referred?

Q. No, but as between any contracts for excavation work?

A. No, that may be true. I don't suppose any two engineers would draw them entirely alike, but there are certain fundamental things to be provided for in the specifications, which if not provided for, will affect the bid price.

Q. Now, you testified it was your understanding that Mr. Freese had allowed, as his general overheads, ten per cent of the direct structural cost?

A. No, but that what he allowed had amounted to about that much.

Q. How did you make that calculation?

A. If, on page 2, you deduct from the total amount of $40,256,862.39, the $5,407,711.99 which he calls non-physical properties, you will have left something less than Thirty-five Million Dollars. Then, if you take the sum of his administrative and legal expenses during construction, engineering and supervision during construction, taxes during construction and interest during construction, constituting the general undistributed overheads, you have, if I have added them up correctly here this time, about $3,900,000.00, which is a little over ten percent.

Mr. Griffith: Of the direct structural costs?

A. Yes, of the direct structural costs.

Q. Well, you forgot to put in the preliminary and organization expense, did you not?

A. No sir, I did not forget to put it in. I left it out [fol. 3391] deliberately.

Q. Did you add them in?

A. No, I did not.

Q. Well, that is one of the overheads, isn't it?

A. It may be classed as an undistributed overhead. It can be, yes, which would add some $194,000.00 to what I set

up here, and change the percentage a trifle. The amount allowed is trivial.

Q. Now, what percentage is that—it is not ten percent, is it? It's approximately 12 per cent, is it not?

* * * * * * *

A. It would be about 11.8 percent, as close as I can read it.

Q. All right. Now then, turn to page 38 of the Exhibit introduced by Mr. Freese, which is Plaintiffs' Exhibit No. 6. On that page, the interest during construction is shown in the total amount of $1,522,468.89, is it not?

A. What page did you say?

[fol. 3392] Q. Page 38 of Exhibit 6.

A. It is $1,522,468.89.

Q. Now, what was the construction period that Mr. Freese assumed for the building of the compressor stations, and for the properties thereunder for the purpose of calculating his interest during construction?

A. I don't know whether he assumed any or not; there is nothing on here to show.

Q. What is your answer—you don't know the period?

A. I don't know.

Q. What did Mr. Freese assume for the transmission system line equipment—the transmission line equipment?

A. So far as I have been able to ascertain, he didn't assume any.

[fol. 3393] Q. So you don't know how he got this $1,522,468.89, the total he shows for interest during construction, do you?

A. Only as shown on page 38, by the application of the percentages there listed.

Q. And you didn't read his testimony as it appears in the record, in connection with this page, did you?

A. No; I heard a great deal of it.

Mr. Griffith: And you still don't understand it?

A. I still don't understand any definite construction period for any of these items or for all of them.

Q. Now, then, you testified, Mr. Biddison, that on the Southern Natural Gas line that the overheads amounted to 18 per cent. How long a line was that?

A. That involved the construction of about—over 1600 miles of transmission system lines.

Q. What was the total cost?

A. Something in excess of thirty-six million dollars.

Q. How much were the overheads?

A. I don't know; they were in excess of 18 per cent of the direct structural costs.

Q. Do you know what the overheads included?

A. Yes.

[fol. 3394] Q. What? Name the items that were included in the overheads, and the amounts for each.

A. I can not name the amounts; I do not have a breakdown of it. I have seen an analysis of those accounts, and know what that ratio was. Those percentages include engineering and supervision during construction, administration and legal expenses during construction, taxes during construction, interest during construction, and preliminary and organization expense.

Q. You don't know how much taxes during construction, do you?

A. No, but I know they paid taxes during construction.

Q. Well, how do you know they did?

A. Well, because I saw the vouchers drawn for which—by which payment was made, and because I helped compute the taxes that would have to be paid.

Q. All right What was the amount shown on the vouchers?

A. I don't know; I have no breakdown on that, as I have stated.

Q. How much of the 18 per cent was for the cost of financing?

A. I don't know; I don't have a breakdown on that. I don't know what that ratio was.

Q. Was the money raised by the sale of bonds?

[fol. 3395] A. Partially so.

Q. You don't know the discount on the bonds at the time they were sold?

A. No, I don't; and that is not a part of that cost of financing.

Q. Well, the sale of the bonds would be a part of the financing, wouldn't it?

A. It would be expense. The out-of-pocket expense in connection with the sale of bonds would be; the discount on the bonds would not be.

Q. And you don't know that amount?

A. I do not.

Q. Now, another one you mentioned was the Southern Gas & Fuel?

A. Yes, sir.

Q. How much line was constructed in this piece of work?

A. About 90 miles of 18-inch.

Q. The cost of financing on this construction work was considerable, was it not?

A. No, the cost of financing on that was not very large; that was a comparatively small item on that one, because that particular concern was owned by a large holding company, which was in position to handle the financing of such matters right promptly on the decision to do the work.

Q. Now, you say the general overheads on this were 20 [fol. 3396] per cent.

Q. Can you tell the items that make that up and the amounts for each?

A. No, not the amounts for each. All I can tell you is that ratio; that is all I try to remember on a lot of those things.

Q. How much did the total job cost?

A. The total job was something in excess of three million dollars.

Q. Do you know what all was included in the general overheads?

A. Engineering and supervision during construction, administration and legal expenses during construction——

Q. Oh, I don't mean just those general classifications, Mr. Biddison; I mean specifically what was included in the engineering during construction and the administration during construction, and all that. You don't know the detail of that, do you?

A. Not now; but I supervised the construction of the job, and passed on all the details while it was being built, and approved the vouchers for payment for it.

Q. You can't break down this 20 per cent by amounts, so we can check up on it, in any way, can you?

A. No; no, I have stated that.

Q. Now, then, what is the expected life of the present [fol. 3397] field lines of the Company?

A. I don't know.

Q. Do you have any idea at all?

A. No, I made no investigation along that line at all, and couldn't hazard a guess on it.

Q. Now, the only thing that you can say about the assumption of the thirteen-year life as used in Mr. Freese's Exhibit No. 7 is that it is wrong—isn't that right?

A. No, I can't say much more than that, and I don't think I said that. I did say that I knew of nothing on which to predicate an assumption of any such figure.

Q. Well, you don't know even how Mr. Freese got his thirteen years, do you?

A. No.

Q. How are you able to say it is wrong, without even knowing how he got the figure?

A. Even if the figure were right, the use of it in that manner does not determine the amount necessary to be set aside for replacements on such an average life.

Q. You say the figure which Mr. Freese used would amortize the total amount of the field lines in 13 years, would it not?

A. At the interest rate he set up, I think it would do that; and that is all it would do.

Q. All right; and if the average life is correct, it would [fol. 3398] provide for the total refunding of the whole investment to the owners of the business in that time, wouldn't it?

A. No, sir, the amortization of the value of a piece of property of thirteen years' life in thirteen years will not return to them the value of the property, unless every individual item of property in that group lives to the full age and full term.

Q. Turn to page 2 of Exhibit No. 7—Plaintiffs' Exhibit No. 7—that is where this 13-year life appears as applied to gathering system rights of way, field measuring station structures, and field measuring station equipment. Don't you see on that page, Mr. Biddison, that in addition to the amortization fund on the field line equipment that per cents from .02 to 1.14 in the 13 years were provided for replacements? Do you see that?

A. Why, I see that it is estimated that the replacements would be at those rates, but I don't see that that is making a provision for replacements. That is merely stating what those replacements amount to, and that is a deduction from the accrual rate.

Q. You didn't know, then, Mr. Biddison, and it is news to you right now for the first time that those are an addition to the amortization rates?

[fol. 3399] A. Well, on the first year there that .02 is deducted from the 5.085, giving the 5.065 in the right-hand column.

Q. Can't you see by looking on this page that the amortization fund is plus the replacement rate of .02, because the annual rate of 5.085, which was used by Mr. Freese— —

A. Maybe I have taken it backwards there.

Q. All right. Now, you have made the statement, have you not, Mr. Biddison, that the cost of replacement is in excess of the cost of—of the original cost?

A. Yes.

Q. Suppose you have rock excavation at the original installation, Mr. Biddison,—would it be necessary to excavate rock again to make a replacement in the line at that point?

A. I expect it would. Maybe not in the same amount.

Q. The rock just sort of grows back by years, doesn't it?

A. I have never noticed it doing that.

Q. Well, why would you have any rock excavation for a replacement, then?

A. Because you are going to have to have a large area to work in for the replacement, and you have to dig out more than you originally dug, in making the replacement.

[fol. 3400] Q. All right; in making a replacement of a piece of pipe, where the line as originally laid was through rock excavation, how large a trench would you have to have excavated to make the replacement?

A. Well, you are going to have two bell holes—two bell holes are going to be dug out, and those bell holes will probably have to be eighteen inches below the bottom of the coupler, in order to provide room to connect up. There is that much rock to be taken out, anyway.

Q. Now, some of these replacements you are talking about and classifying as replacements, are as much as ten and fifteen mile stretches, are they not?

A. Some of them might well be that, yes.

Q. Now, in the case of a sizable replacement of that sort, how have you figured in the salvage value of the pipe taken out?

A. I haven't made any figures on the salvage value of the pipe.

Q. Do you know what the salvage value of the pipe as taken out is?

A. Why, it might be anything from nothing on up to twenty-five, maybe thirty, per cent.

* * * * * * *

[fol. 3401] Q. In Mr. Connor's Exhibit, page 153, this statement occurs: "It has been impossible from an analysis of records to determine the net value of salvable material involved in the replacement, removal, or abandonment of the Main Lines and Tap Lines of Lone Star Gas Company." Do you subscribe to that?

A. I don't know anything about it. I did not make any such analysis. I don't know whether it is possible to determine it or not.

Q. You would have to know what the worth of the pipe taken out is—what the salvage value is—before you can find out what the cost of replacement is, wouldn't you?

A. To get the net difference you would have to know that.

Q. That is what you are trying to find?

A. I am not trying to find it.

Q. The difference in cost of the pipe that is being used for replacement as compared with the original construction; isn't that what we are talking about?

A. No; the statement I made was that the cost of replacements of such work ordinarily done piecemeal was greatly in excess of the cost of original installation.

Q. And if you are making that statement as you now make it, you are not considering in any way the salvage [fol. 3402] value of the pipe taken out?

A. No; because that is not a part of the replacement. That has necessarily to be considered in the adjustment of the property account when the adjustment is made, but it is not a part of the cost of replacement.

Q. Would it be considered in any way in the determination of the annual depreciation rate?

A. Yes.

* * * * * * *

[fol. 3403] Ed C. Connor, a witness for Defendant, resumed his testimony, and testified as follows:

Cross-examination.

Questions by Mr. Fitzhugh:

Q. Refer to your Exhibit No. 49, Mr. Connor, table 2. The heading on this page is Main and Tap Lines, calculation of major removals, based upon plaintiffs' Exhibit 7, page 4. Do you have with you Plaintiffs' Exhibit 7?

A. I have.

Q. Turn to page 4 of that exhibit. By comparing page 4 of Plaintiffs' Exhibit 7 with your table 2, Defendant's Exhibit No. 49, will you show how you reasoned from page 4 of Plaintiffs' Exhibit 7 to get any of the figures shown on your exhibit?

A. Why certainly. Mr. Freese, in his Exhibit 7, page 4, column 4, sets out the annual accrual to provide for major removal of pipe in service, which is .289 per annum.

Q. What was that percentage to be applied to?

A. It was to be applied to the pipe in service, by years, and it is the only way it could be applied. You could not apply it to pipe which had never been put into service in the system of the company.

[fol. 3404] Q. Pipe in service when, Mr. Connor?

A. I applied it to the pipe in service as it went into service, from the beginning of the company's operations.

Q. Why did you do that?

A. Because that is the way it would have to be accrued, and that is the way it shows on page 4, from the year 1, forward.

Q. Do you mean to say that is Mr. Freese's testimony on that exhibit?

A. I don't know what his testimony is, but that is what the exhibit shows.

Q. That is just your interpretation of what you think Mr. Freese's testimony was, isn't it?

A. This exhibit shows that he sets up annually .289 per cent to provide for major removals.

Q. Don't you know, Mr. Connor, that that percentage of .289 was to be applied to the present pipe in the system?

A. Yes, as of this date, but not in the year 1912, because the pipe that is in the system today was not in the system

in 1910, 1911 and 1912. You could not start out in 1910 and apply .289 per cent to 4,000 miles of transmission system, when there wasn't but 250 miles of it in service.

Q. Do you know how Mr. Freese found this .289?

A. Yes; I know exactly.

Q. How did he find it?

A. He found it by dividing the total number of feet in service as of this date by the number of feet of pipe that [fol. 3405] had been replaced, removed or abandoned and classified as major removals. That is correct.

Q. Is that all he did?

A. That is the way he determined it.

Q. Didn't he divide that amount by the number of years?

A. Yes, and he assumed, when he did that, that every foot of pipe in service as of this date had been in service all along, and that is not correct.

Q. Notwithstanding that, this figure of .289 per cent represents an average, does it not?

A. Yes and if, according to Mr. Freese's tabulation on page 4, that percentage would be applied to the footage of pipe in service for each year from the beginning of the company's operations, and that is exactly what I have shown on table 2 of Exhibit 49.

Q. Didn't Mr. Freese's method, the way he worked it out, show that there should be allowed, from the very year that the company started in business, replacements amounting to on the average of 30 miles per year?

A. I don't think so. I don't think Exhibit 7 makes or sets out any such thing. It shows that in the first year of the company's operations, you would set up a reserve accrual of .289 per cent. Now, what could that be applied to in the first year of the company's operations, except the pipe which was in service during the first year of the company's operations?

Q. You understand that the computations on page 4 of [fol. 3406] Plaintiffs' Exhibit 7 do not apply to the first year of the company's operations?

A. Why, it so states right on the exhibit.

Q. Where does it?

A. It says, Year One.

Q. That doesn't mean 1909, or the first year of the company's operations, does it?

A. Mr. Freese testified, if I recall his testimony cor-

rectly, that these percentages, if applied to the operations of the company from the beginning of operations, would have provided all the necessary replacements, removals and abandonments from the very beginning of the company's operations, and in that connection, assuming that every calculation on page 4 of Mr. Freese's Exhibit 7 is correct, and this exhibit of mine more or less indicates that they might not be correct, but assuming that every calculation on that page is correct, still these calculations of mine, in my opinion, do not meet the chief error which lies in this method of reserve accrual calculation.

Q. Just to sum up the whole thing, Mr. Connor, you don't have any idea what Mr. Freese did, do you?

A. I know exactly what Mr. Freese did.

* * * * * * *

[fol. 3407] Q. On page 4, Mr. Freese shows the annual rate for replacements and amortization, in per cent, as used by him, to be 1.70, does he not, Mr. Connor?

A. That is correct. 1.70 per cent, which included .47 for amortization and 1.23 for replacements.

Q. Now, that 1.70 per cent was not to take care of any major removals, was it?

A. No sir, it was designed to provide, assuming that this property was brand new as of this date—it was designed to provide a fund to amortize the property and make replacements in the property upon the assumption that the property as of the date of this inquiry was brand new.

Q. Mr. Freese's testimony on this point was as follows, reading from the record, page 3023:

"To this annual amount of 1.70 percentage sufficient to both make replacements and amortize 100 per cent the cost of the property during its life time, we have added a percentage of .289 per cent to make major removals, and .150 [fol. 3408] per cent to make major rehabilitations, giving a total of 2.139 per cent per annum. There is very little regularity about the way these major removals take place. The heavy removals were in the earlier history of the company when there was a comparatively small amount of pipe in the system. However, the total of major removals during the history of the company, up through 1931, was 659 miles of three inch equivalent pipe."

A. That was in the main lines only.

Q. Mr. Freese further says: "Now, the percentage relation of those major removals to the total amount of pipe in the system as of December 31, 1931, was 8.54 per cent, and the ratio would be substantially the same today."

Now, where Mr. Freese says the total amount of pipe in the system as of December 31, 1931, what does that apply to?

A. It applies to the total amount of pipe in the system today; there is no question about that. I knew just exactly what Mr. Freese did, and there was no need for you to read that testimony back to me. What Mr. Freese has done, is to set out, on page 4, a series cumulative of annual replacement rates which he applies to the property of the Lone Star Gas Company in the Year One. Now, for those rates to have any practical application from the standpoint of Mr. Freese's own exhibit, they would have to apply to the pipe successively put into this system from the year one. Otherwise, he would be assuming that at the very beginning of the operations of this company, every foot of [fol. 3409] pipe in the system today was then in existence which was not true. He also pre-supposes however, clearly on column 2 of page 4, that you will start at the very beginning of this property when it is one year old, because his replacement rate which he shows in column 2 is taken from the replacement rate which he calculates would be made on pipe one year old.

Q. Well, just to show that you did not understand what Mr. Freese was doing and that you did not apply what Mr. Freese has done in his Exhibit 7, page 4, you ended up with 320.83 miles in your calculations as against his 659 miles of removals?

A. Yes, and that is exactly the number of miles which would have been provided for during the history of this company, had you applied the percentage that Mr. Freese shows in column 4, page 4, to the property which was in service each successive year from 1910 and the twenty-two years succeeding.

Q. You mean if they had applied your percentage, instead of Mr. Freese's percentage?

A. No, sir; I mean if they had applied Mr. Freese's percentage.

Q. Now, you carried your computations from table 2 over into your table 5, didn't you?

A. No, sir; table 5 has nothing to do with table 2.

Q. You mean you didn't intend for it to; is that it?

A. Why, no; I didn't. Table 5—you are referring to my table 2, aren't you?

Q. Yes.

A. Table 5 refers specifically to the table set up on page [fol. 3410] 6 of Plaintiffs' Exhibit 7, which has to do with gathering lines, and my Table 2 has to do with replacements and removals of main lines and tap lines.

Q. Well, in your column E on table 5, didn't you make the same interpretation of major removals as you did on table 2?

A. No, sir. I made the same application of it, yes, because Mr. Freese shows on page 6 of Exhibit 7, in Column 3, that 2.77 per cent, accrued annually against the gathering lines of Lone Star Gas Company, would provide for all of the replacements which would be required in the gathering lines of Lone Star Gas Company, together with the major removals of the gathering lines, and in addition thereto would accrue a credit balance of 77 per cent at the end of twenty years. I applied that per cent that he said would do that, to the gathering lines of the Lone Star Gas Company as they were actually laid, by years, from the year 1913, through 1932, and instead of accruing a credit balance of 77 per cent, we have a negative figure in that credit balance.

Q. All right, now on page 1 you take the figure of 320.83 from table 2, and use that in your computations on page 1, did you not?

A. Yes, and very properly so.

Q. Instead of the 659 miles that Mr. Freese actually used?

A. Yes, but you never would have accrued 659 miles, or whatever that figure is, if you had applied that rate from the beginning of Lone Star Gas Company's operations.

[fol. 3411] Q. That is your interpretation of it.

A. That is the only interpretation that can be placed on it, as shown by the exhibit itself.

* * * * * * *

Q. Now, on table 1, the total pipe mortalities from physical causes as shown on this page, in your Column C, are 337.75 miles of three inch equivalent.

A. That is correct.

Q. Is that right?

A. Yes.

Q. Now, from the beginning of the company's operations and covering the lines shown in the A column, what were the total mortalities of pipe, actually?

A. I can not tell you that, Mr. Fitzhugh, the exact from Column A, because Column A is adjusted, as is set out in the exhibit, and other items of property or other lines are included in subsequent calculations. Including the lines which are provided for in table 3 and table 4, the total mor- [fol. 3412] talities to date, that is, of July 1, 1933, were 6,066,627 feet of equivalent three inch diameter pipe.

Q. Is that a figure of the actual total mortalities on account of physical causes only?

A. No, it is not.

Q. What is it for physical causes only?

A. 2,003,486 feet of equivalent three inch diameter pipe.

Q. Now, from the curve which you used for mortalities in your own exhibit, what were the corresponding mortalities, that would compare with this 337.75 miles of three inch equivalent?

A. I have expressed it in three inch equivalent diameter pipe, in feet, Mr. Fitzhugh, and if it will be perfectly satisfactory to you, I will confine my answers to feet, because all my calculations are made on that basis. The actual replacements and abandonments due to physical causes, of main lines and tap lines, according to the records of the company, were 2,003,846 feet. My calculated replacements and abandonments covering the same period of time were 2,044,522 feet. That is assuming that the replacements were made in accordance with the renewal rates which I have set out in Exhibit 42.

Q. That covers the same period as shown on table 1, doesn't it?

A. No, it does not. I confined the tables in this Exhibit 49 to the period of time shown in Plaintiffs' Exhibit 7, page 12.

Q. Well, at any rate, for this same period of years, these twenty-two years, your mortality curve would show a less number of replacements than Mr. Freese's curve, would it not?

A. I don't know. I wouldn't be surprised but what it [fol. 3413] would, because the characteristics of the curves

are different during the early years of the pipe life, and the chief difference between the curve which I have used, and that which Mr. Freese has used, is its behavior in the future. There was no reason in the world why Mr. Freese could not have made that calculation to make it come out exactly.

Q. Well, the way you have computed Table Number 1, Mr. Connor, wouldn't it be more nearly applicable to your curve than to Mr. Freese's mortality curve?

A. No. I think Mr. Freese made exactly the same sort of calculation when he tested the results of his own curve. That is just a practical way of doing it.

Q. Well, if you show on table 1 a less number of mortalities than Mr. Freese shows, wouldn't that show that it would come closer to applying to your mortality curve than to his?

A. Well, it might show a lesser number there because I am quite sure Mr. Freese in making these applications did not break this footage of pipe down into the three groups which I have done. To the 337.75 miles of three inch equivalent diameter pipe there must be added 19.48 miles of three inch equivalent shown in table 3 and 7.41 miles of three inch equivalent shown on table 4. In other words, the calculations on table 1 are not the entire amount which I ascribe to Mr. Freese's calculations.

[fol. 3414] Q. Well, I will ask you this, Mr. Connor,—for this same period of time covering the same property, isn't Mr. Freese's mortality curve more liberal to the Company than yours?

A. I don't know. I wouldn't be surprised but what they are very much alike up to that point; now, that is net results.

Q. You couldn't answer one way or the other on that?

A. No. I imagine they are very close together. In that connection, however, I think the critical test in this instance is what may happen in the future.

Q. Do you have Plaintiffs' Exhibit No. 6 there, Mr. Connor?

A. Exhibit 6?

Q. Yes, sir.

A. No, sir, I haven't, Mr. Fitzhugh.

Q. Well, you know the total amount that Mr. Freese allowed for interest during construction, do you not?

A. No, sir, not offhand. (Copy of exhibit is here handed to witness by counsel for Defendant.) I have the figure before me now, Mr. Fitzhugh.

Q. The figure is $1,522,468.89, is it not?

A. That is correct, yes, sir.

Q. Now, you testified at length to what Mr. Freese did in computing his interest during construction. Can you tell me, Mr. Connor, what the period used by Mr. Freese for the construction of the general office building was?

A. I don't think that I testified at length to the construction period used by Mr. Freese, because I don't think he used any construction period.

[fol. 3415] Q. Well, do you know — the period of time used by Mr. Freese for the construction of the Dallas office building was?

A. No, I don't know the individual times, Mr. Fitzhugh. I think I understand the method that he used.

Q. Do you know what period of time he used for transmission line equipment?

A. No, sir, I don't on the individual lines.

Q. Do you know what period of time he used for the construction of compressor stations?

A. No, but I imagine he sets it out somewhere in the exhibit.

Q. Well, do you know for any of the items of property the period of time that Mr. Freese used?

A. No, I don't.

Q. Now, Mr. Freese, when he testified, testified at length. Did you read the record on that or hear his testimony?

A. Oh, yes, I heard his testimony.

Q. Now, without knowing what periods of time he used on any of the classifications of property, you are still willing to say that his figure is wrong?

A. Yes, sir.

Q. And that is about all you know about it, isn't it Mr. Connor——

A. No.

Q. —that you don't agree with him?

A. No, I know a great deal about it, I think, Mr. Fitzhugh.

Q. Did Mr. Freese in finding his general overheads use [fol. 3416] the book cost?

A. No, I don't think he did.

Q. What did he use?

A. He used a method of computing which I think, perhaps, was based somewhat on his analysis of the charges which had been made to the account of general and undis-

tributed overheads, but he modified that, as was disclosed by his testimony.

Q. He considered, did he not, all the operating expenses for the period?

A. Yes, I think he did; that is correct.

Q. And when he got through he had about four times what the actual general overheads on the property constructed were, did he not?

A. As reflected by the Company's books?

Q. Yes, sir.

A. That is correct. I don't think that the figure you—the multiplier that you cite is correct; but I know that he did increase the actual charges by some factor which he applied.

Q. And in spite of the fact that he ended up with four times as much as the books actually show, you still say he is wrong about it?

A. Absolutely. I agree with you, Mr. Fitzhugh, in your statement that you made yesterday that historical costs have no particular application to the reproduction costs of a property.

[fol. 3417] Q. Well, I made that statement in connection with a particular type of property, did I not?

A. Yes; and I think it applies equally to all property when you make a reproduction cost estimate. I don't think you can——

Q. I was talking about the computed high powered guesswork that Mr. Steinberger brought in here at the time, wasn't I?

A. I don't know how you feel about Mr. Steinberger's records, but I don't think they are high powered guesswork. I think they are excellent construction records. Furthermore, I don't believe it would be proper in making a reproduction cost estimate to assign or ascribe great emphasis to the historical costs in one part of the estimate and then throw historical costs out of the window in checking up on the other part of the estimate.

Q. You didn't understand, then, yesterday that my objection to Mr. Steinberger's historical cost was the fact that it was a computed cost rather than an actual cost?

A. No; I just understood you to say that historical costs were not particularly applicable in a reproduction cost estimate; and I agree with you, Mr. Fitzhugh.

Q. Yes. Well, you understood me, Mr. Connor, just about as well as I understand Mr. Freese?

A. I think so.

Q. Now, you have already testified that you estimated yourself in testifying before the Railroad Commission that the total life expectancy of Texas wells—being those wells [fol. 3418] connected on December 31, 1931—was 13.86 years?

A. I don't know that I did that, Mr. Fitzhugh. I can't recall just exactly what I said. I might have testified that the decline in rock pressure between two periods would indicate that fact.

Q. Just to refresh your memory, Mr. Connor, I will show you an exhibit. On page 83 of the exhibit that you introduced as Exhibit No. 18 before the Railroad Commission, didn't you testify that the total life expectancy of Texas wells, there being 347 connected as of December 31, 1931, was 13.86 years?

A. That is correct. Based on the rock pressure decline within a given period of time.

Q. And notwithstanding that testimony of yours, you now object to the use of a 13-year life for the equipment, lines, and so on attached to wells?

A. That is correct; I do.

Q. Was there anything wrong with your computations?

A. No, not with those computations, but in the application of the computations.

Mr. Griffith: You mean Mr. Freese's application?

A. Yes. The decline of the life expectancy indicated by the decline in rock pressure in a group of wells in any given period might mean a great deal and might mean nothing at all. The life of a gas well is dependent upon the rate at which gas is taken from the well, and not the passage of [fol. 3419] time at all; and you could make a decline in rock pressure on wells in one year which would be ten times the amount of the decline indicated by that period; and the life of your wells would not be controlled at all by anything except the rate of withdrawals from those wells.

Q. Well, what was the use of making this computation if you didn't want to use it on anything?

A. Well, I have come to the conclusion after a year's study that there wasn't any use in making it.

Q. Yes, sir. Now, then you testified yesterday that the

general overheads allowed by Mr. Freese constituted ten per cent. of the physical property costs?

A. No, sir, I did not. I answered a question propounded by counsel relative to that percentage. I did not figure any percentage.

Q. Well, what was the actual amount he used?

A. I think Mr. Biddison made a calculation subsequently that indicated that the percentage was approximately 11.8 per cent.

Q. All right, sir. You and Mr. Biddison fell into the same error on that, didn't you?

A. No, sir, I didn't fall into any error at all. I made no computation.

Q. Well, that was the first time, then, when Mr. Biddison made the correct calculation, when you knew what the per cent. was?

A. I was not interested in the per cent; I was interested in the amounts ascribed to the individual accounts.

[fol. 3420] Q. All you knew, as a general proposition, was that Mr. Freese was wrong, is that it?

A. That is correct.

Q. Now, you introduced an exhibit showing the attachment of business on various lines. I believe your exhibit covered Lines L, O, and a couple of others—K and another?

A. I show in the exhibit, Mr. Fitzhugh, the rate of attachment of business on Lines L, E, and O, and the history of the use of Line K.

Q. Do you know what the earnings for the business upon Line K have been?

A. No, because earnings on Line K would mean nothing at all, because there are very few sales made off of Line K, and K is what might be called a major transportation unit which delivers gas into a group of other lines.

Q. Do you know what the earnings on Line O have been?

A. No, I don't know what they have been, Mr. Fitzhugh; but they would have been considerably more than they have been if that business had been instantaneously attached.

Q. As a matter of fact, you are not able to segregate earnings by Lines, are you?

A. No; I wasn't interested in it.

Q. Now, what difference would it make whether your business came fast or whether it came slow if all of the time you were allowed to earn a sufficient return on your property being used in public service?

A. Are you speaking now historically?

[fol. 3421] Q. Yes, sir, at any time. I am asking you this question,—does it make any difference right now—to-day—whether your Company is using a hundred per cent. of its line capacity or only ten per cent., or whether it only has ten per cent. of its customers attached or whether individual customers are only using ten per cent. of their potential consumption of gas, so long as your Company is being allowed to get a fair rate of return on its property used in public service?

A. Why, it makes all the difference in the world.

Q. Why does it?

A. Why, because if you had ten per cent. of your business attached to the system of the Lone Star Gas Company there is no rate that could be fixed in the world which would allow you to earn anything on that property.

Q. Well, I am asking you for the purposes of my question if you are getting enough in your rates to earn yourself a fair rate of return on your property investment, now assuming that,—could it possibly make any difference whether you had three customers on the line of three billion customers on the line?

A. No, sir, if you want me to assume that three customers would pay the rate of return on seventy millions of property through their gas rates, I am willing to agree to your hypothetical question.

Q. It would not make any difference whether they used ten per cent. of your line capacity or a hunderd per cent?

[fol. 3422] Q. All right. Now, it would take a history of the company to find out whether you have been deprived of a fair rate of return since the very day you started business?

A. No, sir, I don't think that has anything to do with it.

Q. You don't want to make that?

A. I wouldn't be interested—I wouldn't be interested in whether the Company made or lost money in making a reproduction cost estimate.

Q. You know, don't you, Mr. Connor, that your Company has always gotten a fair rate of return on its value through rates?

A. I do not know.

* * * * * * *

Q. Now, this matter or consumer attachment is something that you say is ordinarily significant in finding going value?

A. Absolutely, or in measuring going value, yes.

Q. In measuring going value, which you found in excess of seven million dollars?

A. That is correct.

Redirect examination.

Questions by Mr. Griffith:

Q. Mr. Connor, in answer to a question propounded on [fol. 3423] cross examination by Mr. Fitzhugh, I understood you to say that your exhibit,—that is, Defendant's Exhibit 49, did not reveal the chief error, in your opinion, in the calculations on page four of Plaintiffs' Exhibit 7?

A. That is correct.

Q. To what error do you refer?

A. If reference is made to page four of Plaintiffs' Exhibit 7, it will be found that in the third column under the heading "Annual Rate for Replacements and Amortization Per Cent", that the figure 1.70 is found, and continues from the year one to the year forty-five. That figure, as indicated by the heading, is the annual percentage which Mr. Freese suggests should be applied to property in service to provide for replacements and to amortize the property. Being a dual function, it is necessary to segregate that figure into its two component parts. A six per cent. sinking fund accrual over a forty-five year period to amortize a hundred per cent of the property would require an annual accrual of .47 per cent. If a .47 per cent is deducted from the 1.70 per cent. shown in column three, there is left an average—a uniform annual accrual for the costs of replacements and abandonments of 1.23 per cent.

Q. And will that be adequate?

A. No, but that is not the particular point which I have in mind. Mr. Freese testified yesterday that the property was approximately twelve years old—that is, the main [fol. 3424] transmission system of Lone Star Gas Company at the date of this figure was approximately twelve years old. If reference is made to page 4——

Q. Of Plaintiffs' Exhibit 7?

A. Of Exhibit 7, it will be found that in the last column there is an amortization fund for the twelfth year of 22.68 per cent. That 22.68 per cent. represents, when applied to the transmission system property only, a sum of money equal to $6,130,000.00, approximately. In order for the calculations which Mr. Freese makes subsequent to the year twelve in the first column to come out, it will be necessary to use that $6,130,000.00, approximately, by the application of six per cent. interest to it. In other words, there will be necessary a supplementary fund created by the use of that money, to provide for an inadequacy of the replacement rates which Mr. Freese's calculations show will be incurred after the thirteenth year. For instance, in the fourteenth year of the proposed life, the replacement rates calculated by Mr. Freese are 1.27.

Q. As shown in the second column of page 4 of Plaintiffs' Exhibit 7?

A. That is correct. That is in actual excess of his accrual for that same year. That excess gradually increases from year to year, as indicated by Table 2, page 4, of Plaintiffs' Exhibit 7. In other words, it is necessary to use a credit balance, assumed or otherwise, in the depreciation reserve, [fol. 3425] according to the computations made by Mr. Freese himself, in order to provide for the inadequacy of his accrual rates for the current and future replacements in the main transmission system of Lone Star Gas Company.

Q. That is assuming an average life of the property of twelve years?

A. As of this date?

Q. Yes.

A. That is correct.

[fol. 3426] Recross-examination.

Questions by Mr. Fitzhugh:

Q. Mr. Connor, all of your testimony that you have given on this matter, and the calculations you have made are based on the same assumption you made in the original exhibit introduced by you that there are no funds now on hand in a theoretical amount, or actual amount either, available for use in making repairs and replacements?

A. I think you have stated my position substantially

correct. However, in view of the importance of my answer, I would like to give it to you myself. It is my position that in so far as the necessary replacements required for Lone Star Gas Company from the date of this inquiry forward are concerned that those rates must be adequate for that purpose and cannot be supplemented to make up for any inadequacy by withdrawals from a credit balance in a reserve accrual theoretical or actual.

Q. And where the records of the Company show that they now have a reserve of fifteen million dollars, your calculations show it would not be necessary for you to call on that for so much as a penny?

A. That is correct; and my answer would be the same if, instead of having a credit of fifteen million dollars, they had had a debit balance of fifteen million dollars.

[fol. 3427] E. F. SCHMIDT, a witness for the defendant, recalled, testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. Mr. Schmidt, there has been introduced in evidence here by the plaintiffs what has been styled Plaintiffs Exhibit 4, and I refer you to page 9-A of that exhibit. Does page 9-A of Plaintiffs' Exhibit 4, in the column headed "12-31-33" disclose the net Oklahoma gas sold in Texas neglecting line loss in thousands of cubic fee- to be 132,381?

A. It does.

Q. Now, that figure of 132,381 would represent 132 billion 381 million, would it not?

A. No; 132 million 381 thousand.

Q. Correct. Mr. Schmidt, in connection with the public service operations of the Lone Star Gas Company, has the service which has been rendered been good or otherwise?

A. The service has been extremely good.

Q. In connection with the public service operations of the Lone Star Gas Company, and at times of maximum or peak demand, has it been necessary for the Company to utilize for the supply of customers in the State of Texas the gas produced and/or purchased in the State of Okla-
[fol. 3428] homa, and also the Oklahoma facilities of the Company?

A. It certainly has been.

Q. If Lines H and 2nd H and Line G were only utilized for a period of one day during an entire calendar year, would it be necessary that the Company utilize Lines H and 2nd H and Line G and the Oklahoma gas produced and/or purchased to meet the demands in connection with its public service business in the State of Texas?

A. It certainly would, or else we would have a shortage of gas in many of those cities.

Q. In North Texas?

A. Yes.

Q. Mr. Schmidt, what was the primary source of gas supply for the Company for the calendar years 1918 to 1924?

A. Petrolia was one of the principal sources; then, following that, in Southern Oklahoma, in what was known as the Keys Field.

Q. Was that in Cotton County, Oklahoma?

A. Cotton County, Oklahoma, yes.

Q. All right.

A. Then a little later the Duncan Field.

Q. Is that in Stephens County, Oklahoma?

A. In Stephens County, Oklahoma, southwest of the city of Duncan. Then in the Fox Field, Oklahoma, which is located northwest of Ardmore in Love County, I believe.

Q. In Cart*ne* County?

[fol. 3429] A. Carter County is correct.

Q. Mr. Schmidt, during the years 1918 to 1924 was the gas produced and/or purchased by the Company in the State of Oklahoma by far the principal amount of the gas which the Company transported and sold at wholesale at the city gates of the towns and cities served in northern and central Texas?

A. It was.

Q. Mr. Schmidt, in connection with the public service operations of the Company within the State of Texas, is the Company able to meet at times the maximum demand or maximum requirements for gas put upon its public service properties or facilities, without the use of the Company's own gas wells, gas well equipment, and other production system property?

A. No, sir.

Q. Is that true both in the West Texas gas fields, as well

as in the Panhandle gas field, or what we know in this case as the Shamrock territory, of Wheeler County, Texas?

A. That is correct.

Q. Mr. Schmidt, some reference has been made in this case to the fact that in the year 1933 the Company was able to buy some 24-inch pipe at a price of approximately two dollars per foot, whereas the quoted price was approximately three dollars per foot. Are you familiar with the [fol. 3430] facts and circumstances attendant upon the purchase of that pipe?

A. I am.

Q. For what purpose was the pipe purchased?

A. The pipe was purchased to replace some pipe in Line O east of Joshua.

Q. East of the Joshua Compressing Station?

A. That is correct. This pipe was National Tube seamless pipe. The manufacturers of this pipe, in order to keep the surfaces smooth, use a certain salt. This pipe, evidently, was left over on an order which the National Tube Company had and it was in storage for some considerable time. The original pipe was 5/16——

Q. Five-sixteenth what?

A. Five-sixteenth of an inch thick.

Q. That is, that was the wall thickness?

A. Five-sixteenth of an inch thick, yes, sir. Theoretically, that pipe would have a weight of about something around 85 pounds a foot. On account of this salt and being in storage for sometime, the salt reacted on the walls, reducing the wall thickness. It was sold to us as 9/32 pipe, which has an average weight of 71 pounds. This pipe actually weighed a little better than 80 pounds, so that the wall thickness was somewhere between 9/32 and 5/16. When we received the pipe,—or rather before the pipe was shipped to us, it was tested at 900 pounds hydrostatic pressure. Every joint [fol. 3431] was inspected and had hydrostatic tests. It was thoroughly cleaned, wire brushed inside and outside, and coated on the outside when shipped. When we received the pipe we were afraid that that salt might continue to react——

Q. On the interior of the pipe?

A. —on the interior of the pipe, and we coated the interior of the pipe with a chemical known as nooxid, manufactured by the Dearborn Chemical Company. This, we

felt, would make the pipe just as good as the standard pipe. The pipe replaced was about 6300 feet——

Q. In Line O?

A. In Line O. And we felt since we could get this pipe at around two dollars a foot, with its added capacity and suitability for our purposes, that we should substitute that for the 18-inch.

Q. Now, Mr. Schmidt, would you have been able to get a price of two dollars a foot upon that pipe if it had not been for the fact that the pipe had had this reaction from the salt application?

A. No, sir; we would not.

Q. Mr. Schmidt, it was not a discount price?

A. No, sir; it was not a discount price.

Q. It was merely a sale of some goods by the National Tube Company which was not considered as suitable for sale according to standard specifications?

[fol. 3432] A. That is correct.

Q. Now, Mr. Schmidt, referring again to Plaintiffs' Exhibit 4, where for the year 1933 the net Oklahoma gas sold in Texas is shown to be 132,381 thousand cubic feet, I will ask you if you have again checked your figures as set forth in Defendant's Exhibit 44, reflecting the net amount of Oklahoma gas produced and/or purchased and transported into the State of Texas?

A. I have.

Q. How did you make that check, and how does that check compare not only with the net amounts of Oklahoma gas produced and/or purchased in the state of Oklahoma and transported into the state of Texas, but also compare it with the figure of 132,381 thousand, shown on page 9-A of Plaintiffs' Exhibit 4?

A. I would like to show on the map how I worked it out on the H System, which brings gas from the Duncan and Chickasha fields. We have at Petrolia two main line meters. I took the measurement on those two meters from our records, and added to that the deliveries off the H System between the Red River, which is the state line between Texas and Oklahoma, and the meters at Petrolia. On the G System, which brings gas from the Fox, Loco, Palacine, and Robberson fields, we have a meter located at Gainesville.

Q. South of the Red River and in the State of Texas?

[fol. 3433] A. Yes, sir. We also have meters at Dixie Junction on the three lines, one coming from the Loco and

Palacine fields, and the other two lines coming from the Robberson-Fox District. So I have two checks. So subtracting from those meters the deliveries in Oklahoma, which was at Marietta, north of the Red River, gave me a check on the Gainesville meter, and I have those figures. On the G System, at Dixie Junction, the three meters showed a total of 567,314 thousand. Subtracting the sales to Marietta, which is south of Dixie Junction, and between these meters and the State Line, Marietta sales were 29,277,000, giving a total delivered into Texas from the G System of 538,037,000. As a check on that meter, the Gainesville meter showed 539,984,000—a difference of 1,900,000 cubic feet.

Q. Well within the range of accuracy of orifice meters?

A. Well, within the accuracy, yes, sir. On the H System the meters at Petrolia showed a total of 465,694 thousand. Adding to that the sales at Petrolia and Byers, and main line sales amounting to 108,421 thousand, gives a net amount delivered into Texas from the H System of 574,115 thousand. Adding that to the G System——

Q. That is the net deliveries of the G System into Texas?

A. Adding the net deliveries of the G System into Texas of 538,037 gives 1,112,152,000 cubic feet of gas delivered from the Oklahoma fields into Texas.

[fol. 3434] Q. And how does that figure check with the figures shown in Defendant's Exhibit 44 which you sponsored?

A. I showed 1,210,791,000, or a difference of about 98,000,000, which is very close for main line measurement of large volumes of gas under high pressure.

Q. Now, Mr. Schmidt, do I understand that the net total amounts shown by your check upon Exhibit 34—that is the net total amounts of Oklahoma gas produced and/or purchased and transported into Texas amounted to 1,112,000,000?

A. That is correct.

Q. Our exhibit 44 I should have said.

A. Exhibit 44 shows 1,210,000,000, and the main line meter shows 1,112,000,000.

Q. Now, Mr. Schmidt, what is the excess of that amount over the amount of 132,381,000 cubic feet shown in the column headed "12-31-33" set forth on page 9-A of Plaintiff's Exhibit 4?

A. A difference of 979,771,000.

Q. Or almost one billion cubic feet of gas?
A. Almost a billion cubic feet, yes, sir.

[fol. 3435] Cross-examination.

Questions by Mr. Fitzhugh:

Q. For the year 1933 how much gas was produced and purchased in Oklahoma?
A. In the Chickasha and Nellie fields, 734,629,000; in the Duncan field, 54,312,000; in the Loco field, 22,580,000; in the Fox field, 653,527,000; Robberson field, 207,007,000; Palacine field, 17,487,000; or a total of 1,690,342,000 from those fields.
Q. How much was used in Oklahoma during 1933?
A. On those two statements, 479,551,000.
Q. Now, you are just talking about certain lines, aren't you?
A. Deliveries from those fields.
Q. Well, what was the total used in Oklahoma during 1933?
A. From all sources, something over a billion feet.
Q. About how much over a billion feet?
A. I do not have the exact figure, but, as I recall, it is one billion two hundred million, something like that.
Q. If your figures are correct, then the excess for Oklahoma would be 490,342,000; is that correct?
A. No, sir.
Q. What is the correct figure?
A. The correct figure is 1,210,791,000.
Q. What was the excess of Oklahoma gas produced and purchased over the actual consumption of Oklahoma?
[fol. 3436] A. The actual consumption of Oklahoma in all towns, regardless of where they are located?
Q. Yes.
A. As against the——
Q. As against the gas purchased and produced in Oklahoma.
A. As against the gas purchased and produced in Oklahoma on the "G" and "H" Systems?
Q. No, on all systems. Now, you understand my question, don't you, Mr. Schmidt? I want to know how much gas was left after you deduct all the gas consumed in Oklahoma from all gas produced and purchased.

A. Well, the gas sold in Oklahoma did not come from these sources.

Q. I didn't ask that. I asked you to make the simple deduction of the gas consumed in Oklahoma from the gas produced and purchased in Oklahoma.

* * * * * * *

[fol. 3437] A. The total production in Oklahoma from the fields as indicated, 1,690,342,000; sales in Oklahoma from all sources, 1,200,000,000, approximately.

Q. Well, now, what is the deduction?

A. That would make 490,000,000, but it doesn't mean anything, because those sales were not made from these sources.

Q. Well, what is the figure?

A. 490,000,000.

Q. Now, how much gas from Oklahoma went into storage in 1933?

A. A small amount of gas went into storage.

Q. How much?

A. I do not have the figures.

Q. How much gas was stored on the Miller lease from Lines "H" and Second "H"?

A. I haven't the figures on it.

Q. You would not be able to say, would you, Mr. Schmidt, whether it was over five hundred million or less than that?

A. No; I would not say it was less than five hundred million.

[fol. 3438] Q. But you don't know how much?

A. No, sir.

Q. Now, then, there has been some testimony in this case, if I remember correctly, that the gas stored on the Miller lease approximates five hundred million cubic feet per year, or for the year 1933. If I am correct in that, there would be a wash-out as to this 490,000,000 feet of gas, would there not?

A. I don't know, because gas from the Fox field goes into storage at Petrolia; from the Fox field five hundred million comes into Texas.

Q. I am talking about gas stored on the Miller lease from Lines "H" and Second "H".

A. I don't know how much was stored on the Miller lease from Lines "H" and Second "H".

Q. Well, when you gave the figure of 132,000,000 cubic feet as taken from Plaintiffs' Exhibit 4 you did not intend for it to be a net figure, did you?

A. That is what it said.

Q. Well, is the figure a net figure?

A. I read the heading into the record that said——

Q. Well, can't you answer "yes" or "no"?

Mr. Griffith: He said that is what it said, Mr. Fitzhugh.

Q. Well, your answer is "yes"?

[fol. 3439] A. Yes, sir, that figure as shown by that exhibit.

Q. Well, isn't that figure exactly correct for the net amount?

A. No, sir.

Q. Why isn't it?

A. Well, I know that five hundred million feet came into Texas through the "G" System—something better than five hundred million. How could 132,000,000 be correct, then?

Q. Well, what do you mean by "net figure"—don't you mean the excess of the total over the amount deducted?

A. Well, you are deducting figures that have nothing to do with production in Oklahoma.

Q. For the current year, Mr. Schmidt, 1934, and judging by the reports that have already come into your department, or for as much of the year as has passed, will the amount of gas produced and purchased in Oklahoma be as much as the gas consumed in Oklahoma?

A. It will be very much in excess, even more than it was in 1933.

Q. What is your basis for it?

A. The figures you just referred to—the statement of it.

Q. You haven't brought in any more gas fields up there, have you?

A. No; we are taking more gas from Oklahoma.

Q. They have dropped off about a million up there yearly up to this time?

A. The total in Oklahoma, I expect, is about the same [fol. 3440] as it has been—the sales.

Q. Don't your own exhibits show it?

A. They do for the years I show, but I have not shown 1934.

Q. Now, then, you have explained, to your own satisfaction at least, Mr. Schmidt, these purchases of pipe?

A. I have explained the actual conditions under which we purchased it.

Q. Now, I will ask you if all the painting on the inside of the pipe was not to prevent interior corrosion of the pipe being placed in the system at or near Joshua, Texas?

A. No, sir. We replaced other pipe in the same system.

Q. Well, Mr. Schmidt, if you have got salt on the inside of the pipe and it is going to cause corrosion, what difference would it make if you paint it over?

A. It counteracted the action of the soil. It was not paint we used; we used a chemical.

Q. What is NO-OX-ID?

A. It is a grease, a chemical.

Q. What is it?

A. It has an inhibitor in it; it is composed of various hydrocarbons and greases.

Q. Well, there isn't anything in it to chemically react on salt?

A. It has other constituents that react with the salt.

Q. What was the chemical that you say reacted?

[fol. 3441] A. I am not a chemist, but I know we had the thing investigated.

Q. Well, you are the General Superintendent—don't you know what the reaction would be?

A. There may be twenty-five different chemicals.

Q. One of them neutralizes salt?

A. Several of them tend to.

Q. Now, then, can you state, Mr. Schmidt, a single actual purchase of pipe made by your company for pipe line purposes where you did not obtain as much as a ten per cent discount below the quoted price?

A. I can't name any purchase, Mr. Fitzhugh, as to price; no, sir.

Q. Now, when your company appeared before the Railroad Commission and testimony was taken there on pipe purchases and we referred you to vouchers for 1931 and 1932 you explained those as being distress purchases?

A. They were.

Q. I will ask you if we ever pulled a voucher on your company yet that you didn't have an alibi for the purchase?

A. I have not made any alibi, Mr. Fitzhugh, that I know of.

Redirect examination.

Questions by Mr. Griffith:

Q. Mr. Schmidt, will you turn around to where you can see the map which has been introduced in evidence and styled Defendant's Exhibit 29; that is the map of the pipe line system of the company, is it not?

[fol. 3442] A. Yes, sir.

Q. Will you refer to Defendant's Exhibit 44, which was prepared by yourself and which covers gas transported by the Lone Star Gas Company for the year 1933. Now, Mr. Schmidt, the Chickasha field is situated in Grady County, is it not?

A. It is.

Q. And you have testified that the Duncan field is situated in Stephens County?

A. That is correct.

Q. Lines from there are Line "H" and Second "H"?

A. That is correct.

Q. Those lines are twelve-inch lines running from Southern Oklahoma to Petrolia, in Clay County, Texas.

A. That is right.

Q. Now, again referring to 1933 prices as set forth in your Exhibit 44, Line "G" is a 16-inch line which extends in a southeasterly direction from Stephens and Carter Counties, Oklahoma, through Love County, Texas, across the Red River into Texas and down to Gainesville, in Cooke County, Texas?

A. That is correct.

Q. Now, off of Line "H" and Second "H" and through various tap lines, and also off of Line "G" in the State of Oklahoma and the lines running into Line "G", the company makes sales of gas, does it not, to the city gates of numerous towns and cities?

[fol. 3443] A. That is correct.

Q. Now, what are those towns and cities which are supplied with gas which is exclusively purchased and/or produced in the State of Oklahoma?

A. Davis, Elmore, Marietta, Maysville, Paoli, Pauls Valley, Sulphur, Wayne, Wynnewood, Loco, Hastings, Ryan,

Temple, Walters, Waurika. Of course, there is a certain amount of small sales——

Q. Just to a few right of way customers?

A. That is right.

Q. Now, in addition to the sales by the company of gas produced and/or purchased exclusively in the State of Oklahoma to the several towns and cities which you have just mentioned, the company also delivers gas to the Loco, Fox and Gas City Compressor Stations?

A. Yes, sir.

Q. Those are compressors stations now operated by the company in Oklahoma?

A. That is correct.

Q. Now, what were the total deliveries of gas or sales of gas by the company in the State of Oklahoma of gas which was exclusively purchased and/or produced in the State of Oklahoma for the calendar year of 1933 as shown by your Exhibit 44?

[fol. 3444] A. With the compressor fuel and main line sales, it amounts to 479,551,000.

Q. Now, that figure appears in the 1933 operations as set forth in Defendant's Exhibit 44?

A. That is correct.

Q. Now, in addition to those sales which you have enumerated, does the company sell at wholesale at the city gates any other gas within the State of Oklahoma and did it so sell any other gas in the year 1933?

A. It did.

Q. What was the source of that gas supply?

A. From the Shamrock field in Wheeler County.

Q. In other words, all other gas which was sold by the company in the State of Oklahoma originated in the State of Texas in the Shamrock field of Wheeler County, Texas?

A. With the exception of the sales at Durant and Hugo.

Q. Those sales being made by Line "E" from the State of Texas?

A. That is right,

Q. Now, what were the sales of Texas-produced and/or purchased gas which were made by Line "A" in the State of Oklahoma during the calendar year 1933?

A. Included with the sales to the Hollis Gasoline Plant, it amounts to 334,938,000.

Q. What were the towns and cities which were supplied wholesale with gas in the State of Oklahoma and which [fol. 3445] gas was purchased and/or produced in the State of Texas and sold by the company?

* * * * * * *

A. The cities of Hollis, Davidson, Frederick, Tipton, Manitou, Snyder, Mountain Park, those are the cities supplied off of Line "A".

Q. Now, what were the sales of gas off of Line "A" in Oklahoma of gas which was produced and/or purchased in the State of Texas?

A. 334,938,000.

Q. Now, you were interrogated concerning the net amount of gas transported from the State of Oklahoma into the State of Texas—and I refer solely to the gas which was purchased and/or produced in the State of Oklahoma. You [fol. 3446] have previously testified that through Line "G" more than five hundred million cubic feet of gas was delivered from Oklahoma into Texas in the calendar year 1933?

A. That is correct.

Q. Did any of that gas coming through Line "G" into the State of Texas go into storage at Petrolia, Texas?

A. Not any, no, sir.

* * * * * * *

[fol. 3447] D. A. HULCY, a witness for Defendant, having been recalled, testified as follows:

Direct examination.

Questions by Mr. Griffith:

Q. Mr. Hulcy, have you examined Plaintiffs' Exhibit 6, that purporting to be a reproduction cost new appraisal of the Texas gathering, transmission, compressing, and general property of the Lone Star Gas Company, as of June 15, 1934?

A. Yes, sir, I have.

Q. As made by Mr. S. W. Freese?

A. Yes, sir I have examined that exhibit.

Q. Have you noted the administration and legal expenses and other overhead and general undistributed costs as set forth in said exhibit?

A. Yes, sir, I have.

Q. Mr. Hulcy, based upon your own experience, what has been true of the relation between historical general and undistributed costs as capitalized by operating companies on construction projects, and as between historical—as between actual general and undistributed costs incurred in connection with wholesale construction of a new project?

[fol. 3448] A. Well, based upon my experience, Mr. Griffith, no comparison can be made of the general or so-called undistributed costs during wholesale construction as with a company—that is, an operating company, which does construction during that operating period. Now, that statement is based upon this,—as stated before, I am Secretary and Comptroller of the Northern Natural Gas Company and its underlying companies. These companies were organized in April of 1930. They constructed a major gathering and transportation system extending from the Panhandle fields in Texas through the State of Oklahoma, the State of Kansas, into the State of Nebraska, and also into South Dakota.

Q. Also into the State of Iowa?

A. Yes, sir, that was a branch off of the main line in the State of Nebraska. These lines were all constructed in the year 1930. Therefore the total administration, legal, and all other overhead expenses incurred by the company for that year were 100 per cent applicable to construction. There were no operating expenses, and in fact that property was turned over for operation as at January 1, 1931. In the year 1931 this transportation system was extended from a point in Iowa on into the State of Minnesota, and for a portion of the year 1931 there was a sizable amount of construction going on. In the latter part of the year 1931 and during the first part of the year 1932 there was very little construction going on. In fact, it might be likened, we might say, to almost 100 per cent operation. Therefore, when the ex-[fol. 3449] penses had been charged directly to construction during the 100 per cent construction period, in this latter period all expenses were made—all charges were made to operating expenses. The personnel was there—the general auditor, the purchasing agent, the supervisor of stores, the chief clerk of the accounting section, the chief distribution

clerk, the chief construction accountant; it was necessary to have each of these individuals during the operating period. Now, beginning in the latter part of 1932 and continuing through the first part of 1933, other sizable extensions were made, including additions to the property account of approximately five millions of dollars. The added personnel due to this construction was very, very small; it consisted of a few minor clerks scattered out in some of the departments; for instance, it was not necessary to employ another purchasing agent, it was not necessary to have another general auditor, neither was it necessary to have another chief distribution clerk, or another chief construction accountant, because those individuals were there. It was necessary during the operating period that all of those employees be had and included in the organization. So for that reason I say that there is absolutely no comparison between the costs incurred during a wholesale construction period and the costs incurred in connection with construction handled by an operating company. Now that has been my experience in connection with matters of that kind.

[fol. 3450] Q. In connection with the construction of a very sizable gas project?

A. Yes, sir, the actual cash costs of this natural gas project—that is, the Northern Natural Gas Company, and its associated companies, are in excess of forty millions of dollars.

Q. And that work has all be- done within the last four years?

A. Yes, sir, begun in April of 1930.

Q. Mr. Hulcy, do you know what the legal expense of the Northern Natural Gas Company was as incurred in connection with the construction of its property?

A. Yes, Mr. Griffith, I have that information in my files, and for the year 1931, for the year 1932, and part of 1933 the amount of legal expense charged to construction was in excess of $400,000.00.

Q. And that was on a property which had a capital account of approximately $40,000,000.00?

A. That is correct. Now, there have been some additional legal expenses charged since that time. However, they would be small when compared with $400,000.00.

Q. Mr. Hulcy, in connection with the Northern Natural Gas Company have you had some experience in connection with the cost of financing and the obtaining of money?

A. Yes, sir, I have.

Q. For construction projects?

A. Yes, sir.

[fol. 3451] Q. Is the Northern Natural Gas Company, in so far as its operations are concerned, substantially similar to the business and operations of the Lone Star Gas Company?

A. Yes, sir, that is correct; the Northern Natural Gas Company and its underlying companies are made up principally of production, gathering, transportation and sale at city gates.

Q. Has the Northern Natural Gas Company within the last two years had occasion to borrow large sums of money for the purpose of constructing natural gas transmission lines and other natural gas properties?

A. Yes, sir, and I would say particularly within a period of three years, and even on down within a period of a year, and later it has been necessary for the Northern Natural Gas Company to make arrangements about finances.

Q. Does the Northern Natural Gas Company at this time have borrowed a very substantial sum of money and which sum of money has gone into the construction of its properties?

A. Yes, sir, they do have.

Q. What total amount does the Northern Natural Gas Company have borrowed as of this time?

A. At the present time approximately sixteen and one-half millions of dollars.

Q. At what rate—what rate of interest is being paid upon that loan, and what is the current cost of that money to the company?

A. The current cost of that money to the company is 7 per [fol. 3452] cent; that is made up of an annual interest rate of 6 per cent plus a bonus of 1 per cent for the option to renew those notes at the end of the six months period; or, in other words, the notes are made for six months, dated as at March first of this year. According to the agreement—and this same agreement has actually been carried out for the past two years—on September first, that is the due date on these notes, the company has the option to renew those notes for another six months period, provided they pay a bonus of one per cent on the total amount of money borrowed. So

that makes the current cost of the money 7 per cent per annum.

Q. Is that money owed upon the straight note obligation of the Northern Natural Gas Company?

A. No, sir, it is not. In addition to the note being signed by the Northern Natural Gas Company it is also endorsed and guaranteed by each of the companies owning the common capital stock of the Northern Natural Gas Company, which are the North American Light and Power Company, the United Light and Power Company, and the Lone Star Gas Corporation, and those are individually and severally.

Q. Does that make, in your opinion, for a well secured obligation?

A. Well, I feel that it does, Mr. Griffith. These three companies which I have just mentioned——

[fol. 3453] Q. That is the North American Light and Power, the United Light and Power, and the Lone Star Gas Corporation?

A. That is correct. The total property account of these three companies is approximately one billion dollars. Now, all of the assets owned by these three companies are behind that note, and that is in addition to the total value of the properties of the Northern Natural Gas Company which is in excess of forty millions of dollars.

Q. Is there any bonded indebtedness outstanding against the property of the Northern Natural Gas Company?

A. No, sir, there is not. This note would have first call; in fact, the remainder is common stock equities.

Q. Which was put into the Northern Natural Gas Company by the three major stockholders?

A. Yes, sir, in cash.

Q. Mr. Hulcy, on yesterday there was some testimony relative to Lone Star Gas Corporation 5 per cent debentures outstanding?

A. Yes, sir.

Q. The Lone Star Gas Corporation does have some 5 per cent debentures outstanding?

A. Yes, sir, they do—an issue in 1927 amounting to some fifteen millions of dollars.

Q. And maturing in what year?

A. In 1942; or, in other words, they are known as fifteen year debentures.

[fol. 3454] Q. Are those debentures the same as a current note?

A. Not the Lone Star Corporation debentures.

Q. Is there any security back of those debentures?

A. Yes, sir, there certainly is.

Q. What is that security?

A. The security back of these debentures is the total of the securities held and owned by the Lone Star Gas Corporation. These securities consist not only of the common capital stocks of the underlying companies owned by the Lone Star Gas Corporation, but also consist of all of the bonds that have been acquired by the corporation in the open market of any underlying company or other company, or, in other words, any security that was at that time in or that has since then come into the possession of the Lone Star Gas Corporation is placed under the indenture for the protection of those debenture bonds.

Q. Now, does the fact that 5 per cent was the coupon rate on those debenture bonds indicate that that was the cost of the money to the company?

A. No; no, it does not for this reason——

Q. Was the cost of the money procured from these debentures more or less than 5 per cent per annum?

A. Well, it was more than 5 per cent per annum.

Q. Why was it more?

A. Well, the debentures were sold at a price of about ninety-five, as I recall. Now, in addition to that there were legal expenses and other expenses involved in connection [fol. 3455] with the issue of the debentures; there was the cost of the preparation of the debenture bonds themselves, and then in addition to that the company does make refunds of certain taxes that are paid on the interest received—that is, both Federal and, I believe, the State of Pennsylvania; so, to whatever extent those refunds are made, plus the amortization of expenses in connection with the issue of the bonds, also the discount in connection with the issue of the bonds, all of those items tend to increase the rate over and above 5 per cent per annum.

Q. And as you say, Mr. Hulcy, that issue was put on the market in the calendar year 1927?

A. That is correct; I believe the issue is dated May 1, 1927.

Q. Was the security market then more favorable for the issuance of natural gas securities than it is now?

A. Well, a great deal more favorable.

Q. Mr. Hulcy, have you examined Plaintiffs' Exhibit 8?

A. Yes, sir, I have. I believe I saw a copy of it on yesterday.

Q. Will you please refer to page one of Plaintiffs' Exhibit 8, which was sponsored in this case by Mr. S. W. Freese?

A. Yes, sir.

Q. Mr. Hulcy, included in the figure of $40,256,862.39, as set forth in the lower left-hand corner of page one of this exhibit, is there included any production system property of the company in the State of Texas, and which production [fol. 3456] system property would embrace and include, among other things, gas wells, gas well equipment, gas well construction, gas reserves—both developed and undeveloped?

A. No, sir, it does not include anything for those items which you have mentioned.

Q. Are all of those properties which the company actually owns within the geographical confines of the State of Texas, used and useful in the public service?

A. Yes, sir, they certainly are.

Q. What would have been the effect upon the calculation made by Mr. Freese in Plaintiffs' Exhibit 8 if he had allowed for depreciation, depletion, and return in respect of the production system properties of the company?

A. Well, in addition to that, Mr. Griffith, if the production system property had been included in his property values there would have been some other adjustments. For instance, Mr. Freese makes an allowance in the year 1933 of $212,031.46 as being the value of the company produced gas. Of course, had he included the property in the production system property in his total property account, then he would not have made that allowance. Also, he has deducted the total production system property expenses, which, had he included the production system property, he would not have eliminated. Now, the calculation that I have made on Exhibit 8 eliminates the following item as [fol. 3457] shown on page 1 of Exhibit 4—that is, the accounting exhibit sponsored by the witness Phillips covering Texas operations—he has eliminated $232,758.70 of production system expense for the year 1933, and that is the amount shown on page 1 of said Exhibit 4. Exhibit 4, on page 11, sets out the property account—that is, of the Texas properties at December 31, 1931, plus the net addi-

tions to the public service property on Texas properties from January 1, 1932, through March 31, 1934. Well, now, just forgetting about the net additions, and assuming that we had no production system property included in that amount at all, there is shown on this page of production system property an amount of $4,432,920.19. Now, if Exhibit 8 had included that property and an allowance of 8 per cent—that is, six per cent for return plus two per cent for depreciation—that amount of depreciation and return would have been $354,623.61, or an exclusion by Mr. Freese in the preparation of his exhibit of an amount of $587,392.31.

Q. Now, that would include not only the 8 per cent upon the Texas production system property, but, as well, the operation expenses which Mr. Phillips determined were applicable to the production system property in Texas?

A. That is correct. Now, as I stated a while ago, Mr. Freese did add, to cover the value of company produced gas, an amount of $212,031.46, and that, deducted from the total elimination, leaves $475,360.85, which is due altogether to the elimination of the production system property from his [fol. 3458] property account and the exclusion of direct operating expenses which were actually incurred in Texas, and set out on page 1 of Phillips Exhibit No. 4.

Q. That is Plaintiffs' Exhibit 4?

A. That is correct—I mean sponsored by the witness Phillips. Now, in addition to that, I have made a calculation showing what the difference would have been in the Federal income taxes. Mr. Freese in calculating his Federal income tax makes an allowance for depreciation and depletion of $831,946.08. However, in arriving at the deduction to be used in the calculation of the Federal income tax he takes depreciation at 5 per cent of his total property account, which is $2,012,843.12, or a net excess depreciation for calculating income tax of $1,180,897.04. Now, the income tax at 13¾ per cent on that amount would be $162,373.35, or a total, including the net deductions on account of production system property being eliminated, of $537,734.20, and that amount when expressed as a percentage of the property values shown by Mr. Freese and set out on page 1 of Exhibit 8 is 1.33 per cent. Now, Mr. Freese further shows on page 1 of Exhibit 8 that the return on the total property account shown by him would be 6.76. Now, if we assume that everything else is exactly right,

that amount deducted from the amount shown by him would be 5.43 per cent for 1933 as available for return.

[fol. 3459] Q. In other words, if you take every calculation of Mr. Freese as correct as set forth in the column on page 1 of Plaintiffs' Exhibit 8 headed "1-31-33" and include the production system property and the production system operating expenses and eliminate the value of company produced gas, you get, instead of the figure 6.76 per cent, as available for net return, the figure of 5.43 per cent.

A. That is correct. However, that adjustment does include the correction on Federal income tax—that is, that the same amount allowed would be used for the calculation of the tax.

Q. And what would be similarly true in respect of the twelve months period ended March 31, 1934, as set forth on page 1 of Plaintiffs' Exhibit 8?

A. Well, I am sure the same thing would be approximately true. I did not make any calculations on that period, Mr. Griffith. However, the amount available for return as shown on page 1 of Exhibit 8 is 6.74 per cent, which is 2/100 of 1 per cent less than the amount available in the year 1933. So, for that reason I say that the final answer would be about the same.

[fol. 3460] Q. Would it be less than five and a half per cent?

A. That would be my judgment in the matter, yes.

Q. Mr. Hulcy, have you prepared an exhibit showing the disposition of gas purchased and/or produced by the Company and transported through the "A" System and the "H" Systems for the year 1933?

A. Yes, sir; I have.

Q. Is this the exhibit to which you refer, being styled on the title cover: "Lone Star Gas Company. Receipt and Disposition of Gas Transmission Systems "A" and "H" Year 1933"?

A. It is.

Mr. Griffith: We offer the exhibit so identified by the witness in evidence.

(Thereupon the exhibit above referred to was marked for identification as Defendant's Exhibit No. 50.)

• • • • • • •

Q. Mr. Hulcy, what does Defendant's Exhibit 50 purport to show?

A. Exhibit 50 is a map showing the receipt and disposi-
[fol. 3461] tion of gas in the Transmission Systems "A" and "H". That is, we start out with the amount purchased and/or produced in the fields, and it shows at each point on the transmission system down to Petrolia, Texas, where the gas is disposed of; and it finally shows the net amount delivered at Petrolia for both the Shamrock Field and the Chickasha-Duncan fields.

Q. For each of the towns and cities north and south of the Red River does it show the total of the city gate deliveries for the particular town or city?

A. That is correct; it does.

Q. After deducting the line sales on the "A" System from the total of the Shamrock Field gas purchased and/or produced, does the map indicate the net delivery of Shamrock gas at Petrolia, Texas to be 3,381,496,000 cubic feet?

A. That is correct; it does.

Q. After deducting all sales made in Oklahoma of Chickasha and Duncan Field gas, either purchased and/or produced, does the map disclose that the net delivery of such Chickasha and Duncan Field gas at Petrolia was 588,673,000 cubic feet.

A. It does. However, included in the sales is the amount of gas sold at Petrolia, Texas and Byers, Texas, which is south of the Red River and north of Petrolia.

Q. And those are two towns, which in the ordinary course
[fol. 3462] of business, receive gas which is solely produced and/or purchased in the state of Oklahoma?

A. That is correct. Now, this map was prepared to set out in detail just the source of supply, particularly of the gas sold in the A-1 System. Now, I mean by "A-1", the gas sold at Frederick, Manitou, Mountain Park, and Snyder; and that was prepared in connection with Exhibit No. 4.

Q. You mean Plaintiffs' Exhibit No. 4?

A. Yes; that is correct, Plaintiffs' Exhibit 4; and I have particular reference to page 9-A, wherein the net gas sold in Texas neglecting line loss is shown, and from that amount of gas a calculation is made for the year 1933, showing the Texas-Oklahoma gas sales adjustment in the amount of $29,617.92; and that amount is then transferred to page

1, or the Summary of Plaintiffs' Exhibit 4, and is shown as a deduction; or, in other words, allowed as an operating expense for the 12 months ended December 31, 1933. Of course, as has been previously said, the gas sold in the State of Oklahoma which has been purchased and/or produced in the State of Texas has nothing whatever to do with the net amount of gas delivered from the State of Oklahoma into the State of Texas; and upon that basis, and upon that assumption, I believe it would be well to offer an example showing that the method used in the preparation of the statement set out on page 9-A of Exhibit 4——

[fol. 3463] Q. Plaintiffs' Exhibit 4?

A. —of Plaintiffs' Exhibit 4 is not correct.

Q. What would have been the effect, Mr. Hulcy, upon the calculations set forth on page 9-A of Plaintiffs' Exhibit 4 if the Lone Star Gas Company had sold off of Line "A" a substantial volume of industrial gas in the State of Oklahoma?

A. Well, there is only shown 132,381,000 cubic feet, being styled as "Net Gas Sold in Texas." Now, if there had been an industrial sale made off Line "A"—a substantial industrial sale—then the net gas sold in Texas would have been negative, and using the same method of calculation it would have added to the Texas revenues, whereas he has allowed it as an operating expense. It would have been necessary to have changed all of his previous years; or, in other words, he would have gotten away altogether from the method he did use. Now, I have assumed, in order that we might illustrate this and show just what the effect would be, that during the year 1933 the Lone Star Gas Company secured an industrial customer located at Hollis, Oklahoma, and this customer would use in round figures five billion cubic feet of gas, and we will assume at a sales price of 10 cents a thousand—however, that does not enter into the calculations. Then referring again to page 9-A of Plaintiffs' Exhibit 4, the gas sold in Oklahoma would be increased [fol. 3464] from 1,135,394,000 cubic feet to 6,135,394,000 cubic feet; or there would be a negative net gas sold in Texas of 4,867,619,000 cubic feet. Now, the average sales price in Texas used by Mr. Phillips was $.24870, or, in other words, approximately 25 cents per thousand cubic feet.

Q. That is shown in the second figure column on page 9 of Plaintiffs' Exhibit 4?

A. On page 9-A.

Q. Yes.

A. Now, this sale in the state of Oklahoma would not have affected in the least his average sales price in Texas, and that negative volume of gas at the average price would amount to $1,210,576.84. Now, the Texas operations would have included as an expense the cost of the gas which was purchased and/or produced in the Shamrock Field of approximately $100,000.00; and we will just assume that there was a small amount of operating expense in connection with that Shamrock Field to the Hollis plant, or to the Oklahoma state line, I should say. Say that is $25,000.00; it would appear as a deduction in the Texas operations, so that amount when deducted from the net Oklahoma gas sold in Texas—the gas sales adjustment would be $1,085,576.84, that would have been handled as a net operating expense; or, in other words, an addition of that amount to net in- [fol. 3465] come for the Texas operations; and all they did was to take the gas out of the field and sell it in the State of Oklahoma; and so when you apply a yardstick of that kind, you get an answer that is wrong; and therefore, I think that all of the calculations where you deduct gas sold in the State of Oklahoma from the gas purchased in the state of Oklahoma, where it has no connection with it whatever, the answer is bound to be wrong. We could as well assume that Oklahoma City was furnished off the Frederick tap off Line "A", and then the volume would be materially larger. There is no connection between them at all, as I see it.

* * * * * * *

Q. The Railroad Commission of Texas evaluated the pub- [fol. 3466] lic service property of the Lone Star Gas Company as of December 31, 1931, did they not?

A. Yes, sir; they did.

Q. Did the Lone Star Gas Company and its affiliated companies purchase any pipe during the year 1931 and early in the year 1932?

A. Yes, sir; they did purchase pipe during that period.

Q. Have you prepared a compilation of those pipe pu chased, and a comparison with the prices actually used b Mr. Freese as of December 31, 1931?

A. Yes, sir; I have.

Q. Is this the compilation to which you refer, bein styled, "Lone Star Group Companies. Statement of Pip Purchases Through Pittsburg Office 1931-1932."?

A. That is correct.

Mr. Griffith: We offer in evidence the compilation s identified by the witness.

(Thereupon the compilation above referred to wa marked for identification as Defendant's Exhibit No. 51

. . . . . .

[fol. 3467] Examination by Mr. Fitzhugh:

Q. Mr. Hulcy, this exhibit shows a bunch of purchase made by the Lone Star Gas Company, Municipal Gas Com pany, Community Natural Gas Company——

A. That is correct; the Lone Star Group Companie statement of purchases that were made through the Pitt burg Office.

Q. What is the largest purchase for the Lone Star Ga Company that you show?

A. Of any particular size pipe?

Q. The largest purchase in dollars?

A. Well, sir; I don't have the dollar value.

Q. Well, do you have it in tonnage?

A. No, sir; I don't. I have it on a one hundred lines feet basis. I might add, Mr. Fitzhugh, that I have her available at this time the original paid vouchers on ever purchase covered by this exhibit of the respective compa nies.

[fol. 3468] Q. By looking down your Quantity Ordere column would it not seem that the largest purchase is i the purchase of 16-inch 47.215 pound per foot?

A. Yes.

Q. Plain end electric weld?

A. Yes, I am sure that is correct. There are two pur chases of 18,200 feet, and I am sure that is the larges single purchase included in the exhibit.

Q. Now, there are no other purchases outside of this on in your exhibit that are more than a carload lot?

A. A single carload? I will say, Mr. Fitzhugh, my judgment is that there would not be anything here in excess of a carload.

Q. So that this purchase of the 16-inch 47.215 pounds per foot pipe plain end electric weld seamless is the only purchase in your exhibit for more than a carload lot?

A. You mean for more than a single carload lot?

Q. Yes.

A. Well, I really am not prepared to say, Mr. Fitzhugh. Very likely the grouping of certain purchases might have exceeded a single carload. I have just shown here the footage involved.

Mr. Griffith: In other words, you have shown the actual purchases?

A. That is correct.

Q. The testimony in this case has been, has it not, Mr. [fol. 3469] Hulcy, that for large purchases of more than a carload lot a different price would prevail?

A. Well, I understood, Mr. Fitzhugh, that it had to be pretty good size lots. Now, whether that dividing point comes in in a carload or not, I am not prepared to say, but it is my understanding that for large lots you do receive a concession and there is a difference in price—that is, small lot purchases at distinguished from large lot purchases. However, this exhibit was not prepared at a period when that division was made.

Mr. Fitzhugh: Now, Your Honor, we make this objection: that all of the purchases shown, except in the case of the 18-inch, or, rather, the 16-inch 47.215 pound per foot plain end electric weld seamless pipe, are not large lot purchases and take a different price from those that are large lot purchases, and therefore they can not be compared with Mr. Freese's price, which contemplates large lot purchases; hence the exhibit will be misleading for all sizes of pipe except the 16-inch. We are perfectly willing for it to go in on any large lot purchases, but we ask that all that are not large lot purchases be stricken.

* * * * * * *

[fol. 3470] The Court: I overrule the objection.

* * * * * * *

[fol. 3471] Direct examination.

Questions by Mr. Griffith:

Q. Now, Mr. Hulcy, please refer to Defendant's Exhibit 51. The Lone Star Gas Company, Community Natural Gas Company, and Municipal Gas Company all have pipe purchases reflected in this exhibit?

A. That is correct.

Q. Were the same pipe prices available to each of the companies at the date of the purchase of each individual purchase of pipe as reflected by the exhibit?

A. That is quite true. All of this pipe was purchased through Mr. J. M. Simpson's office in Pittsburgh, and he receives the same price for one company—that is, the Community Natural Gas Company or the Municipal Gas Company—as he would for the Lone Star Gas Company. There is no difference at all.

Q. Mr. Hulcy, taking up your pipe purchases in order, will you please explain how the exhibit is prepared?

A. It might be well to make this statement, Mr. Griffith, before we start. When I show Mr. Freese's price f. o. b. the mill, and Mr. Fitzhugh said it would not be a fair comparison, I mean by that the prices Mr. Freese used in his 1931 appraisal, and he got his prices from these very vouchers that I have got here. They are one and the same thing. So I thought it well to make that explanation. It [fol. 3472] is not what we have used in this present proceeding.

Mr. Fitzhugh: Do you mean the prices Mr. Freese shows f.o.b. the mill were taken from some other appraisal?

A. They are taken from the prices used by Mr. Freese before the Railroad Commission.

Q. And were the prices adopted by the Railroad Commission?

A. Yes, sir; they were.

Q. In its opinion and order in evidence?

A. Yes, sir; they were. This statement or exhibit has been prepared, showing the name of the company that purchased the pipe, shows the delivery point, the size of the pipe, weight per foot, whether it was single length or double length, shows the order number, shows invoice date, quantity ordered, voucher number, voucher date, and shows purchase price f.o.b. mill, gross and net.

Q. What do you mean by "gross and net"?

A. When I say "gross and net", the gross is the list price or the selling price; the net is less two per cent for cash discount if you pay within a specified time. In the quotation f.o.b. the mill it shows both gross and net and the price used by Mr. Freese at the mill, both gross and net. I have lined up opposite to the purchases upon which Mr. Freese has made his determination all the costs of the pipe. That is not true, though, on the two-inch, for the reason that there wasn't any purchase during the year [fol. 3473] 1931 where the price corresponded with the price used by Mr. Freese.

The Court: That applies to the two-inch pipe?

A. Yes, sir.

Q. Are these prices per 100 lineal feet f. o. b. mill Mr. Freese's prices f. o. b. mill?

A. That is correct; that is the price per hundred lineal feet. During 1931 the Lone Star Gas Company purchased —it is a matter of record—37,000 feet of two-inch 3.652 pound lapweld pipe. Mr. Steinberger in the preparation of his appraisal made an error and used a quoted price covering two-inch buttweld pipe instead of lapweld pipe, and to that extent he was wrong. He used a net price of $11.12 per hundred lineal feet. The quoted price for two-inch was $13.41 per hundred lineal feet. The smallest pipe—the smallest price paid by the company during 1931 for two-inch lapweld pipe was $12.01 per hundred lineal feet. On all other sizes of pipe—that is, where there was a specific purchase—Mr. Freese used the actual purchase price as his price. However, he did not do that on the two-inch. In making his calculation on the four-inch pipe he arrived at a discount to be used—and when I say "discount" I mean the discount applied to the net price used—of $12.78 per hundred lineal feet; so he applied that same discount to the two-inch buttweld price and thereby ar- [fol. 3474] rived at a net price of $9.70 per hundred lineal feet. There is not a great deal of the two-inch buttweld pipe in the Lone Star Gas Company System. Whereas the actual quoted price December 31, 1931, was $13.41 per hundred lineal feet, and the smallest amount paid by the company for the actual pipe purchased in 1931 was $12.01 per hundred lineal feet.

[fols. 3475-3486] Q. Now, Mr. Hulcy, you have made reference to certain vouchers in connection with these pipe

purchases—these various pipe purchases. Do you have those vouchers here?

A. Yes, sir, I do, right here—every one of them.

* * * * * * *

[fol. 3487] Q. In order that there may be no confusion about Defendant's Exhibit 51, would you be agreeable to having written above the words, "Quotation F. O. B. Mill", the words, "As of December 31, 1931."?

A. Yes, sir; that is what I intended.

Q. And would you also be agreeable to having written above the heading "Freese's Price F. O. B. Mill", the words, "As of December 31, 1931."?

A. That is correct.

Mr. Griffith: Mr. Reporter, will you make that change [fol. 3488] on the original copy of the exhibit?

(Thereupon the Reporter made the changes requested in Defendant's Exhibit No. 51.)

A. That is what those two columns were intended to cover.

Q. Now, Mr. Hulcy, during the calendar year of 1934 has the Lone Star Gas Company purchased any pipe?

A. I think there have been a few purchases,—no, I don't believe the Lone Star Gas Company has purchased any pipe; I can refer to the records here and tell you. (Refers to data.)

Q. Have any of the affiliated companies purchased any pipe during the calendar year of 1934?

A. The Lone Star Gas Company has not purchased any pipe in 1934. However, the Municipal Gas Company, the Community Natural Gas Company, and the Lone Star Gasoline Company have purchased pipe and/or casing through the Pittsburgh Office during the year 1934.

Q. Were those purchases in large or small lots?

A. Purchases of small lots.

Q. At what prices were those purchases made?

A. They were made at the quoted prices.

Q. Current as of the time the purchase was made?

A. Yes, sir; that is correct; current with posted or quoted prices as of January 2, 1934.

Q. Are those purchases rather extensive?

A. No, sir; they are not.

[fol. 3489] Q. Will you state what they are, and the prices which were actually paid by the Company for these small lot purchases—or by the companies which you mentioned, for these small lot purchases in the year 1934?

A. There has been introduced as an exhibit in this case, I believe Defendant's Exhibit 34, which sets out the quoted prices on pipe, effective January 1, 1934, on large lots. Now, I have a tabulation here which shows the quoted prices for both large lots and small lot purchases. The first purchase was for the Municipal Gas Company, purchased from the Frick Reed Supply Corporation, of 2⅜ inch O.D., 3.652 pounds per foot, plain end lap weld pipe. The quoted price for that particular pipe net is $13.97 per hundred lineal feet for large lots.

Q. Is that shown on page 1 of Defendant's Exhibit 34?

A. Yes; it is. The corresponding price for small lot purchases is $15.17. Under date of March 2nd, the Municipal Gas Company purchased 2000 feet of this particular pipe at a price of $15.23 per hundred lineal feet delivered. That was subject to one-half of one per cent cash discount on the mill value, and the one-half of one per cent cash discount applied to the $15.23 price, brings it back to exactly the same as the quoted price delivered for that size and weight pipe. The Municipal Gas Company also purchased under date of April 20, 1934, 8,000 feet of 4½ inch O.D., [fol. 3490] 10.790 pounds, plain end lap weld line pipe. By referring to page 1 of Exhibit 34, the large lot quoted price is $35.58 per hundred lineal feet; the corresponding price for small lots is $38.51. The price paid by the Municipal Gas Company for that particular pipe delivered is $38.66, and one-half of one per cent cash discount applicable to the mill value, is the same as the quoted price. 6⅝ inch, O.D., 18.974 pounds, plain end lap weld line pipe, under date of March 7, 1934, the Municipal Gas Company purchased 2000 feet of this particular pipe to be delivered at Denton, Texas at a price of $68.11; shown on page 1 of Defendant's Exhibit 34, the cash price is $62.68 per hundred lineal feet. The corresponding price for small lot purchases is $67.85. The $68.11, the actual price paid by Municipal Gas Company for that particular pipe, when discounted by one-half of one per cent for cash discount, is the same as the quoted price as of that date. Now, I believe that those are typical, Mr. Griffith. There are some purchases of 2⅜ inch pipe, and then there is some casing.

Q. Is it true, without exception, Mr. Hulcy, that in the calendar year of 1934, all pipe purchased, of which you have knowledge, has been purchased at the prices quoted by the mill manufacturers?

[fol. 3491] A. That is correct; and that is so indicated by all of the vouchers I have on these particular purchases of pipe made in 1934.

Q. Is it your testimony that the prices current and quoted as of 1934 for either large or small lot purchases by the mill manufacturers are not subject to a discount of from ten to fifteen per cent?

A. That is correct.

Cross-examination.

Questions by Mr. Fitzhugh:

Q. Mr. Hulcy, on page 20 of the Railroad Commission of Texas' order this language is found: "Mr. Freese in making his appraisal of the Transmission Line Equipment applied to the basic quotations (as of July to December, 1931) the discounts actually obtained by the Lone Star Gas Company as indicated by the last 1931 purchases of carload lots or more of various weights of pipe." Is that correct?

A. That is correct. However, it was not on carloads of pipe—I just read into the record where those prices were based on purchases of 400 feet and up, and it was not on carloads.

Q. Now, show a purchase of less than carload lot where Mr. Freese based his price?

A. All right, sir. On the 10-inch, 31.445 pounds, lapweld [fol. 3492] pipe, the price used by Mr. Freese was $76.93 per hundred lineal feet, and that was based on a purchase of 400 feet under date of November 20, 1931, which was paid for in December, and covered by Lone Star Gas Company Voucher M-164, at a price of $76.93, or exactly the same price used by Mr. Freese.

Q. Was that less than a carload shipment?

A. Yes, sir; I would say it is.

Q. Did that come by local freight?

A. No, sir; I don't think it did.

Q. Can't you look at your voucher and find out?

A. That voucher would only cover 10-inch pipe.

Q. It might have been part of a carload, might it not?

A. Might have been; but it was not a part of a carload of ten-inch pipe.

Q. You can't say that that was not part of a carload lot, can you?

A. No, sir; but it is not a part of a carload of 10-inch pipe. These are the prices, F. O. B. Mill, and it would not make any difference whether they came by express, fast freight, slow freight, or how.

Q. The language in the Commission's order goes on as follows: "In other words, Mr. Freese used the actual price paid by the Company for its last 1931 purchases of the various weights bought during 1931." Is that correct?

[fol. 3493] A. I think that is generally correct. As to purchases made by Lone Star Gas Company, that would be right.

Q. "Where purchases of particular weights were not made during 1931, Mr. Freese applied the discount actually obtained on the last 1931 purchase of the nearest weight." Is that correct?

A. That is correct. I tried to make that clear in my testimony.

Q. "The effect of Mr. Freese's computation was to use the actual cost of the pipe to the company based upon the last 1931 purchases." Is that true?

A. Well, of course, while giving effect to applying the same percents that he found on the same particular purchases of pipe, however, that is not true of the 2-inch pipe. There was plenty of 2-inch pipe bought in 1931, and which Mr. Freese did not use at all.

[fol. 3494] Q. How much two inch pipe did you have in your inventory?

A. I don't know, but I do know that there are several hundred miles of two inch pipe.

Q. All right, the order proceeds: "The Lone Star Gas Company bought large amounts of pipe in 1929, having purchased a total of several million feet of all sizes of pipe up to and including twenty inch during that year. Basic quotations on pipe were maintained at a constant figure by the manufacturers throughout the year 1929." Is that correct?

A. I am not prepared to say, Mr. Fitzhugh. I was not interested in 1929. I was only interested in the prices used by Mr. Freese, as compared with the cost prices.

Q. You don't know anything about the 1929 prices?

A. No, sir.

Q. Or the discounts?

A. I do not recall anything about the details of it.

Q. All right, skipping over the part that applies to 1929, this statement occurs: "The discounts from the 1929 basic quotations were substantially the same on the large amounts of pipe bought during 1929 as were obtained on the relatively small purchases made during 1931." You don't know whether that is true or not, do you?

A. No, sir; I do not.

Q. The order continues: "Mr. Freese used the same method of arriving at the discounts for threaded and coupled pipe as he used for the larger quantities of plain [fol. 3495] end pipe, i. e., discounts off of the December 31, 1931, quotations were based on the last purchases of each weight made during 1931." Is that correct?

A. Perhaps that is true, Mr. Fitzhugh. I did not tabulate any cases; the only thing I was interested in was the lap weld, plain end pipe.

Q. Then the order says: "In arriving at the discounts to be applied to the December 31, 1931, quotations on electric welded pipe, Mr. Freese based his discounts on a sizeable purchase of electric welded pipe bought in August, 1931. If the pipe actually purchased were seamless pipe, as one witness testified, then the discount off of the higher quoted seamless pipe price would have been even greater." Now you have discussed that purchase, have you not?

A. Yes. That is the sixteen inch plain end electric weld pipe which was actually seamless pipe.

Q. That's the pipe you discussed. Now, is that last statement I quoted to you a correct one?

A. No, I don't think that is correct at all, Mr. Fitzhugh, for this reason. I think it is very evident on that particular purchase of pipe that the purchase price was not anything like the quoted price or the fair price of the pipe and what they would charge for that particular pipe at all, but it does show that they had a more expensive production hand and which was included in their inventory and they were willing to make concessions in order to move the pipe. That would [fol. 3496] not be the quoted price or the fair value of that pipe at that date at all.

Q. The order continues with this language: "The Company defended its use of quoted prices by citing instances

where gas distributing companies had paid the quoted prices. The tonnage of relatively small pipe required by the distributing companies cited is not to be compared with the very large tonnage of transmission line pipe, field line pipe, well casing, etc., currently required by Lone Star Gas Company." Do you subscribe to that statement?

A. Are you talking about the application of prices now—do you mean that these purchases made for the distribution companies do not compare with the purchases made by the Lone Star Gas Company?

Q. As of December 31, 1931.

A. So far as the purchases are concerned, Mr. Fitzhugh, there is just as much and more pipe which was bought at prices in excess of the pipe bought by Lone Star Gas Company, as was the volume of pipe upon which the Lone Star Gas Company prices were based in this particular inventory.

Q. Now this statement occurs: "On the other hand, Mr. Freese cited the actual purchase of 2,221,272 feet of large and small pipe by the Lone Star Gas Company at prices less than the quoted prices by the approximate amount of the discounts which he used." Isn't that true?

A. I did not hear that testimony. However, that did not [fol. 3497] enter into the calculation of Mr. Freese's prices, because his prices were based on specific purchases in 1931, and we did not have purchases of any such amount of pipe bought in 1931.

Q. Don't you think that a check of 2,221,272 feet of pipe purchases, of all sizes of pipe, would be a pretty good check on your pipe prices.

A. That is a very sizable amount of pipe.

Q. Now, look at your Exhibit 51; you don't mean to say, do you that any of the prices contained in Exhibit 51 have been applied to the present appraisal by Mr. Freese?

A. No, sir, I do not.

Q. But he has used, just as you have, in the present appraisal, the quoted prices?

A. My understanding is that Mr. Freese in his appraisal used the quoted prices as at December 31, 1931, and that is—or rather, excuse me—I mean at December 31, 1932, I believe, and his appraisal is dated June 15, 1934. Is that correct?

Q. But Mr. Freese testified that any increase in pipe prices which he adopted as of the date of your appraisal in

bringing it up to June 15, 1934, was offset by the allowance for omissions and contingencies which he was inclined to disallow?

A. I believe I heard part of Mr. Freese's testimony in that connection, and if I remember correctly he said one of the main reasons he was not giving effect to the increase in pipe prices was because the company always had and did now receive substantial discounts from the quoted prices, [fol. 3498] and as of this date I do not subscribe to that at all.

Q. So you don't know whether Mr. Freese actually used, as of the date of his appraisal, the current quoted price of pipe or not, do you?

A. I know he did not use the current quoted prices as of June 15, 1934.

Q. You don't know whether the effect of his appraisal was to do that, or not, do you?

A. Well, that is my understanding—that he did not make any corrections in the prices of pipe used in the company appraisal which was dated January 1, 1933, and so I would assume that he did not use the current quoted prices.

Q. Didn't Mr. Freese testify to this, Mr. Hulcy—that the difference in pipe prices, as between January 1, 1933, and as of June 15, 1934, was approximately $900,000.00 for the whole system, the part that he appraised?

A. I do not recall that amount, but I do remember there was a sizable difference in it.

Q. But that the amount for omissions and contingencies would also be in the amount of $900,000.00, which would exactly offset, so that he made no change?

A. Now, perhaps that was the testimony. I will admit I was not following his testimony closely all along.

Q. All right now, if that was his testimony, the effect of his appraisal would be to apply just exactly the quoted prices of pipe, just exactly as you did, or as the company did in their appraisal?

[fol. 3499] A. As the Company did?

Q. Yes.

A. Of course, I don't know that the company made an appraisal giving effect to June 15, 1934 prices, but it is my understanding that Mr. Freese used the quoted prices for pipe as of December 31, 1932, or rather, January 1, 1933, and as you state, if he offset or eliminated omissions and

contingencies, and desired to place that on pipe, and he had calculated that $900,000.00 was the difference in pipe, then Mr. Fitzhugh, I think it would be the equivalent of giving effect to the present quoted prices of pipe, assuming those calculations are as you stated them.

Q. Yes, exactly. Now, can you point out in this Exhibit 51 that you have introduced here, where the Lone Star Gas Company in a single instance paid the quoted prices for pipe purchased?

A. Most all of the purchases made by the Lone Star Gas Company were in the early part or by the middle of the year. The purchases that I have here shown at the end of the year are the ones made for the distribution companies, and they are—or in a number of instances, they are made at the quoted prices.

Q. There are some purchases that the Lone Star Gas Company made itself that were not more than a month prior to the date of Mr. Freese's appraisal, aren't there?

A. I think there may be possibly one or two scattered through from September on to December, Mr. Fitzhugh.

Q. Well now, just answer my question. Can you show in here, or cite a single instance of any price for pipe appearing in this whole exhibit where your company, the Lone Star [fol. 3500] Gas Company, actually paid the quoted price?

A. Now, this is limited to the Lone Star Gas Company, that you have reference to?

Q. Yes sir.

A. All right, sir; I will take a look through here and see if I can find you one. No, sir; not at exactly that price. However, on the sixteen inch 47.215 pound lap weld pipe, two purchases were made at a price in excess of the purchase price.

Q. But in no instance was the exact quoted price paid, was it?

A. No sir, it was not. This was in excess of the quoted price. However, those purchases were made in the month of February, 1931, and there is no reason why they should exactly check with the quoted prices as at December 31, 1931.

Q. Now, on that sixteen inch pipe, what was the last price paid by the Lone Star Gas Company?

A. The last price actually paid was $124.91.

Q. What did Mr. Freese use in his appraisal?

A. $124.91.

Q. The same price, wasn't it?

A. The same as the purchase in April, 1931, or eight months prior to his appraisal.

Q. It was the one made in May, you mean?

A. It was paid in May. The invoice date was April 24, 1931.

Q. That was the last purchase made before the date of Mr. Freese's appraisal, wasn't it?

A. Yes.

Q. Now, what did the company use in their appraisal?

[fol. 3501] A. The company used the quoted price of $148.72.

Q. Now, how much higher was the price that the company used, over the last actual purchase price of pipe of that same size?

A. The quoted price of $148.72 is $23.81 per 100 lineal feet in excess of the actual amount paid for one thousand feet of that pipe in May, 1931.

Q. That $23.81 difference is a difference of about twenty per cent over the price actually paid, isn't it?

A. Yes, about 19 per cent.

Q. Now, does the company usually get a better price on large purchases of pipe, or on small purchases of pipe?

A. I don't know, Mr. Fitzhugh, just which of them they would get the better price on. Of course, all of that is determined by whether or not the pipe is on hand. I would say if you were going to make purchases of larger sizes of pipe and large lots of pipe, you would come nearer to paying the quoted price than you would on some small scattered prices on small pipe. That means the mill would have to be set up ready to run, for the larger quantities, and the other means that they might have it in their inventory on hand and would like to move it out, just as any other merchant likes to move his merchandise.

Q. This purchase was on 1,000 feet of pipe?

A. On the 16 inch?

Q. Yes, the purchase made in May, 1931?

A. Yes.

Q. To which you applied a price of $124.91 per hundred feet?

A. That is the price paid by the company.

[fol. 3502] Q. Now, if your company had been buying, instead of the one thousand feet of sixteen inch that they

actually purchased, enough of this sixteen inch pipe to reproduce all the sixteen inch of this weight in the company's system, wouldn't you have gotten a lower price than the $124.91 per hundred feet as actually paid?

A. No sir, I certainly don't think so. The pipe people would just go out of business right quite on setting up their mill to run and turning out large volumes of pipe on any such a basis as that.

Q. Aren't you familiar with the fact, Mr. Hulcy, that the current quotations of pipe for large lots are substantially less than the current quotations for the very same pipe, when bought in small lots?

A. That is correct; it is at the present time, yes.

Q. And it has always been that way, hasn't it, Mr. Hulcy?

A. No, I don't know that that is correct at all, because I know these small lots have been purchased in some cases at less than the quoted prices. Larger lots of pipe of the same size and a little bit later, while the quoted price was the same, are purchased at prices equaling the quoted prices.

Q. Nevertheless, in each case where your company has purchased pipe at less than the quoted price, ever since the time this rate investigation first started, you have had some excuse for it haven't you?

A. Yes, I certainly have had some excuse for it. There has been a reason.

[fol. 3503] Q. And in each case you have claimed that those were distress purchases, or purchases of distress pipe?

A. Mr. Fitzhugh, a large part of the pipe that has been purchased since 1931, along in there, has been at distress prices; there is no question about that, and of course that is not limited to the pipe mills alone—that also applies to other lines of business.

Q. And I suppose, following the same reasoning, Mr. Hulcy, where the quoted prices now, for purchases in large lots, are less than the quoted prices on small lot purchases, you would still say that the purchases on large lots would be distress prices, wouldn't you?

A. No, sir; I would not say they would be distress. I think it is clearly set out whether you are purchasing small lots or whether you are purchasing large lots.

Q. All right now, take the first size of pipe that shows

2079

in your exhibit; the price that you have included in Mr. Freese's price column is the price he applies to lap weld pipe?

A. Yes, that is the price which he has applied to the lap weld pipe.

Q. And the purchase prices you have compared with Mr. Freese's price are purchases of butt-weld pipe?

A. No; sir; they are lap weld pipe. We have practically no butt-weld pipe in our system.

Q. What do you mean, then, by including underneath your gross and net in the quotation FOB mill column (1369) and (1341)?

A. Those are the gross prices, both the gross and the net [fol. 3504] for two inch lap weld pipe. The company in the preparation of their appraisal made an error and used the quoted price for butt-weld pipe, which is $11.35 gross and $11.12 net.

Q. As compared to Mr. Freese's price of $9.70.

A. Yes, and I explained this morning, Mr. Freese arrived at his price of $9.70, not basing it upon any purchase made by the company, but that they did purchase over 37,000 feet of two inch lap weld pipe in 1931; but that his price was based upon one single purchase of four inch pipe in 1931, and that he had arrived at a discount of 12.78 per cent, and he applied that discount to the price which was used by the company in error as applying to two inch lap weld pipe, and he therefore arrived at a price of $9.70, whereas the lowest price paid in 1931 by the company was $12.01.

Q. So you say that both the company and Mr. Freese were in error on those prices?

A. Yes, the company used a butt-weld price, which is cheaper than the lap weld.

Q. All right, take the next size of pipe.

A. Yes, sir.

Q. The three inch. What was the last purchase made by the Lone Star Gas Company of three inch in 1931?

A. The last purchase of three inch made in 1931 by the Lone Star Gas Company was six thousand feet, in August, at a price of $16.27.

Q. Now, what price did Mr. Freese use in his appraisal on this same size?

[fol. 3505] A. $16.27.

Q. What did the company use in its appraisal?

A. $24.58.

Q. What is the percentage of difference?

A. You want the percentage of what?

Q. I want to know by what percentage is $24.58 higher than the price actually used by Mr. Freese of $16.27 per hundred feet of three inch pipe?

A. It is approximately fifty per cent.

Q. In other words, the company used a price of fifty per cent over what it paid on the last purchase in 1931?

A. That is correct.

Q. Take the next size of pipe, the four inch. What was the last purchase of pipe of this size made by the Lone Star Gas Company in 1931?

A. The last purchase in 1931, of the four inch, was in November, 1931, at a price of——

Q. Aren't you mistaken? Wasn't it in August, 1931?

A. Well, yes, you are correct. There was only one purchase by the Lone Star Gas Company of that particular size of pipe; you are correct.

Q. In August, 1931?

A. That is correct. I was looking at the Community Natural Gas Company.

Q. That was some four or five months before the date of Mr. Freese's appraisal?

[fol. 3506] A. Yes.

Q. Now, what price did Mr. Freese use—he used the same price, didn't he?

A. Yes.

Q. As against that which the company used, of $26.52 per hundred feet?

A. Yes, that is correct.

Q. And again the company used higher than the actual purchases of such pipe in 1931 by the Lone Star Gas Company?

A. If you restrict this to 1931, yes, for the Lone Star Gas Company, but the purchase was made through the same source as the other.

Q. Now, the next size is six inch?

A. Yes, that is correct.

Q. What was the last purchase by the Lone Star Gas Company of six inch in 1931?

A. The last purchase by Lone Star Gas Company in 1931 was in December, 1931, where they purchased six thousand feet at a price of $44.10.

Q. That was almost at the very date of Mr. Freese's appraisal, wasn't it—the same month?

A. Yes, the invoice date was November 20, 1931, and the pipe was paid for in December account, Voucher M-164.

Q. Now, that voucher that showed that purchase had not been put on the books of the company at the time Mr. Freese made his appraisal, had it?

[fol. 3507] A. Well now, I don't know. Mr. Freese's appraisal was dat- December 31, 1931; I do not know just when it was comple- The auditors were there all along.

Q. Well now, Mr. Freese never did see that voucher, did he, Mr. Hulcy?

A. I don't know whether he did or not.

Q. Don't you know the voucher wasn't in the company records and a part of the company's records when Mr. Freese made his investigation?

A. I don't know when he made his investigation. I understood Mr. Freese to say these prices were furnished to him by his auditors, or the auditors of J. A. Phillips & Company. The auditors or the employees of J. A. Phillips & Company have been in the Lone Star Gas Company's office for a good long time, and whether they saw this actual voucher or not, I don't know, Mr. Fitzhugh.

Q. All right. Anyway, Mr. Freese used the same price in his appraisal as appears on that voucher, didn't he?

A. No, sir. The last purchase was in December, 1931. Mr. Freese used the same price as was paid by the company in July of 1931 which was $40.82 per 100 lineal feet, but the last in December of 1931 was not used by him. The one he used might have been the last one he saw.

Q. Now, the company used in its appraisal a price of $46.84 per hundred feet, as in contrast to the price which Mr. Freese used?

[fol. 3508] A. That is correct.

Q. Now, the next size of pipe is eight inch?

A. Yes.

Q. In July, 1931, the company was buying this size of pipe for $56.84 per hundred feet?

A. Yes. They bought three thousand feet in July and August, at a price of $56.84 per hundred feet.

Q. And the same price prevailed in August as in July?

A. Yes.

Q. And that is the same price Mr. Freese used in his appraisal, isn't it?

A. Yes, that checks with the price that Mr. Freese used in his appraisal.

Q. As contrasting with the price of $56.84 used by Mr. Freese in his apraisal, and as actually being paid by the company, the company put in its appraisal a price of $64.06 per hundred feet, didn't it?

A. Yes, that was the quoted price on that pipe as at December 31, 1931.

Mr. Griffith: And it was also the price actually paid in September, 1931, by the Municipal Gas Company, wasn't it?

A. Yes, it was.

Q. Well, these smaller companies always pay the quoted prices, don't they?

A. No sir, I wouldn't say that, Mr. Fitzhugh. The quantity of this pipe that we are talking about on the Lone Star [fol. 3509] Gas Company purchase was three thousand feet, two thousand feet of it purchased in August, and one thousand feet in July. This other purchase we are talking about is eight thousand feet, and when that mill makes a price on that pipe, they don't know whether it will be for the Municipal Gas Company, the Lone Star Gas Company, or who.

Q. They don't, huh?

A. No. Mr. Simpson just puts in the order.

Q. Well, then, turn back on your first page there.

A. Yes.

Q. Can you point out an instance there on page 1 or page 2, Mr. Hulcy, where purchases were made by the Lone Star Gas Company and any of these distributing companies at about the same date where the same price was paid?

A. Well, I don't know whether I can or not, Mr. Fitzhugh. I will take a look, though, for it if you want me to.

Q. All right.

A. On two inch pipe, in the month of May, 1931, the Lone Star Gas Company purchased eight thousand feet.

Q. Where are you now?

A. On the two inch pipe, on the first page. That was in May, 1931, when the Lone Star Gas Company purchased eight thousand feet of it, at a net price of $12.25. Now in the month of May 1931, the Municipal Gas Company purchased

5,000 feet of the same size and weight of pipe, for delivery at Hillsboro, Texas; at a price of $12.25 per hundred feet, or [fol. 3510] exactly the same price paid by the Lone Star Gas Company.

Q. All right now; June 15, 1931, the Lone Star Gas Company bought it for a net price of $12.01 per hundred feet, didn't they, Mr. Hulcy?

A. That is correct, they did.

Q. Now how do you explain that purchase at $12.01 per hundred feet, where they bought three thousand feet, as compared with the Municipal Gas Company's purchase of five thousand feet of the same size pipe at $12.25?

A. Well, sir, you are talking about different dates, there. This purchase I referred to was in May, and the Lone Star Gas Company purchase I referred to was in May, and now you are talking about June 15th.

Q. Well, there wasn't any difference in the quoted price as of those times, was there?

A. I don't know, Mr. Fitzhugh.

Q. Wasn't the same quoted price prevailing?

A. I don't know.

Q. As of those two dates?

A. I could not tell you, sir. The only quoted price I know anything about was the quoted price at December 31, 1931.

Q. All right now, go on to the twelve inch.

A. That was all of those prices that you wanted me to look for—that is, those that were the same?

Q. Well, you haven't found any others, have you?

A. It takes a little time to go through these. I will be [fol. 3511] glad to look for them, if you want me to.

Q. Take your time—take your time. Look hard.

A. I am only trying to do what you wanted there, Mr. Fitzhugh, that's all. It may be that is the only one.—I think that is about all of that I see. The dates don't very well check up. Most of the purchases of the Lone Star Gas Company seem to be, as I said before, in the first half and along about the middle of the year.

Q. So the only purchase you can find a date to compare the prices with, as to these distributing companies and the Lone Star Gas Company prices, is on these two inch stuff, which is a very insignificant item in the system of the Lone Star Gas Company, is it not?

A. When compared with twenty inch, it is not very much, no sir.

Q. Either in size or in price?

A. Well, it is considerably less than the twenty inch, too.

[fol. 3512] Q. Now, take the 12-inch.

A. Yes, sir.

Q. The last purchase of this pipe was in November, 1931?

A. That is correct.

Q. At a price of $98.00 per 100 feet?

A. Net, yes, sir, that is correct.

Q. And that is the price used by Mr. Freese in his appraisal, is it not?

A. That is correct.

Q. Now, what is the price the Company used in their appraisal?

A. $103.69.

Mr. Griffith: That was the quoted price at the end of the year, was it not?

A. All of these prices are the quoted prices at December 31, 1931.

Q. Well, the quoted price didn't change on any of these sizes of pipe during 1931, did it?

A. I couldn't tell you, Mr. Fitzhugh; it has not been necessary for me to keep up with those things, and, as I have said, the only quoted price I was interested in was the quoted price at the dates these appraisals were made. Now, whether it changed on November 15th, or any other date, I don't know.

Q. Now, on this 16-inch pipe, the last purchase, I believe you say, was at $124.91?

[fol. 3513] A. Yes, sir, that was purchased—the invoice was dated on April 24, 1931.

Q. And the price used by Mr. Freese was that price?

A. Yes, sir, that is correct.

Q. As opposed to the Company prices used in its appraisal of $148.72 per 100 feet?

A. Yes, sir, which was the quoted price at December 31, 1931.

Q. Now, the 18-inch plain end, seamless, the last quoted price was the price used by Mr. Freese, was it not?

A. You mean the last quoted price or the last purchase price?

Q. The last purchase.

A. Yes, that was the only purchase in 1931, Mr. Fitzhugh.

Q. That purchase was made in September, 1931, was it not?

A. That is correct.

Q. The price used by the Company, and contrasted with $143.42 per 100 feet, is $179.91 per 100 feet?

A. Yes, sir, which was the quoted price at December 31, 1931.

Q. In other words, the price used there was about 35 per cent higher than the last purchase?

A. You mean the only purchase.

Q. Yes, sir; or $35.00, I mean. I said 35 per cent, I believe.

A. Yes, sir; $36.00.

Q. Or stated as a per cent, it would be about 25 per cent, would it not?

A. Yes, sir, 25 per cent, plus.

[fol. 3514] Q. Now, the only sizable purchases that you have got in this whole exhibit are the two purchases of 16-inch made in August, 1931, totaling 36,800 feet?

A. Those are the major purchases in 1931—that is of any particular sized pipe.

Q. The actual price paid on this purchase of pipe was $143.39 per 100 feet, was it not?

A. That is correct.

Q. But the price actually used by the Company in its appraisal was $161.53 per 100, was it not?

A. That was the quoted price at December 31, 1931.

Q. Now, that is the last size of pipe you actually had purchases on?

A. That is correct; there were no purchases on the 18 and 20-inch, plain end, electric welded pipe.

Q. When you first started out your testimony, Mr. Hulcy, you testified something about the legal expenses of the Northern Natural Gas Company.

A. Yes, sir, I did.

Q. What was the legal administration actually experienced by the Northern Natural Gas Company?

A. I don't believe I testified about that, Mr. Fitzhugh. I was testifying particularly about the comparison of legal and administrative expenses under wholesale con-

struction and piecemeal construction carried on by an operating company.

[fol. 3515] Q. Well, you wouldn't object to a comparison of the other overheads, would you?

A. No, sir, I wouldn't object to anything that I would be able to tell you about—that is, at this time.

Q. All right; what was the amount of actual taxes during construction?

A. I couldn't tell you, Mr. Fitzhugh; but we did have some taxes during construction on a part of the—I recall very distinctly on a part of the line being constructed in Iowa, that that line was started in the early part of the year 1930; I have particular reference to the line being extended on up from the Missouri River on up to Mason City. Now, there were taxes involved in that, during a construction period.

Q. Well, now, pick out some State that has got a tax system something like we have. Iowa is different, isn't it?

A. Well, sir, I don't know whether it is or not, Mr. Fitzhugh. I do know that we did have some taxes up there during a construction period.

Q. Do you know how much they were?

A. No, sir, I couldn't tell you now.

Q. It was a very insignificant amount, at any rate, wasn't it?

A. Well, our taxes were sizable up there. That was a new line of business for those people up there in that part of the country, and they believed in getting what they could.

[fol. 3516] Q. Yes. What was the interest during construction on that line?

A. Well, I don't know just of any particular line, Mr. Fitzhugh, but the interest during construction was at six per cent.

Q. Six per cent of what?

A. Six per cent per annum from the time that the project started.

Q. You mean you borrowed money at six per cent?

A. Yes, sir, we borrowed money at six per cent, plus this bonus that was paid. Now, that was paid by the top company.

Q. I want to know what is the amount that you capitalized on the books for interest during construction on that construction work.

A. Well, I didn't bring those books of the Northern down here, Mr. Fitzhugh. If I had known that you wanted that, I would have been very happy to have done it, because I do believe that we have accurate records on the books of exactly what the costs are.

Q. Now, you are the Secretary, Comptroller and Treasurer of that line, aren't you?

A. Not the Treasurer, just the Secretary and——

Q. And Comptroller?

A. Yes, sir.

Q. Wouldn't you be apt to carry those figures in your [fol. 3517] head, Hulcy, on such an important construction job?

A. Well, Mr. Fitzhugh, they are only included—in that group there are about twelve companies, and there are seventeen in the Lone Star group. I used to try to carry figures in my head some, but I found it didn't pay. I sometimes found that I was wrong about figures; therefore, I quit trying to remember them.

Q. Incidentally, the Lone Star Gas Company did all of that construction work, did they not?

A. No, sir, they certainly did not.

Q. They loaned their construction gang for it, didn't they?

A. No, sir, they did not.

Q. There are not any entries on the Lone Star Gas Company's books for the construction work of the No-thern Natural Gas Company?

A. They built a few pipe line bridges and two compressor stations, but that is all. They had nothing to do with the construction of the transportation system from Texas to Minnesota and South Dakota.

Q. There are entries appearing on the Lone Star Gas Company's books with which you are well familiar, aren't there, Mr. Hulcy——

A. Yes, sir, I am familiar with them.

Q. —that show payments to the Lone Star Gas Company [fol. 3518] for work done on the Northern Natural?

A. Yes, sir, just as I testified, that was in connection with the construction of two compressor stations and certain pipe line bridges, but had nothing whatever to do with the construction of the transportation system.

Q. And the books of your Company show that for that

work the Lone Star Gas Company got $200,000.00, which it passed on then to the Lone Star Gas Corporation?

A. Yes, sir, about that—something less than two hundred thousand.

Q. And for which $200,000.00 the Lone Star Gas Company never got any credit at all in its operating statements as revenues?

A. No, sir, they didn't; they were not entitled to it.

Q. Now, all you can remember about the whole Northern Natural proposition is that the legal expense was about $400,000.00, or one per cent?

A. Well, the $400,000.00, I believe I stated this morning, Mr. Fitzhugh, that that was for the year 1930, for the year 1931, and part of 1932. Now, at that time the property account was not up to $40,000,000.00. There have been extensions made.

Q. Well, how do you know it was one per cent, then?

A. I don't know that it was one per cent. I am talking [fol. 3519] about the amounts that were capital- —

Q. At the end of the period at which you to- —$400,000,00 off of the books for the legal ex- — what was the amount of the property account?

A. I can't tell you, Mr. Fitzhugh. I just had in my files the legal expenses that had been capitalized up to that time. I have forgotten now what was the reason for getting that information.

Q. So that the legal expense is bound to be based on less than a forty million dollar property account and less than one per cent. I was wrong in my one per cent, wasn't I?

A. Well, it would be in excess of one per cent, then, if you get down less.

Q. Yes, a little more than one per cent.

A. It just goes the other way, you see.

Q. That is right—that is right.

A. Yes, sir.

Q. In making your valuation of leaseholds, you deducted all of the gas well equipment, did you not?

A. Yes, sir, I did.

Q. And all operating expenses by future years?

A. Recovery costs, you have reference to?

Q. Yes, sir.

A. Yes, sir, I do.

[fol. 3520] Q. Those might properly be called operating expenses, might they not?

A. Recovery costs or operating expenses, whichever you prefer to call them; either one.

Q. Now, you objected, if I caught the force of your testimony, to the elimination of those same expenses by Mr. Freese?

A. In this Exhibit 8?

Q. In his Exhibit 8.

A. I certainly would object to it, Mr. Fitzhugh. They were expenses that were actually incurred by the Company, and so found by the auditors for the Commission.

Q. Well, now, if you were willing to eliminate and deduct all of the operating expenses in your calculation, why do you object to Mr. Freese doing the same thing?

A. Well, I will tell you,—you never did find me coming up with a profit and loss statement with these items eliminated, Mr. Fitzhugh. I was arriving at a value of property, and it has no connection whatever with profits and losses.

Q. Well, the way Mr. Freese worked it out, he was doing the same thing.

A. No, sir, he was not. He was talking about revenues and expenses, and I was arriving at a present fair value or [fol. 3521] present worth, if you please, of the gas reserves of the Company, and profit and loss statements had no place in any such exhibit which I sponsored here.

Q. Mr. Hulcy, didn't you allow in your computation the full well-head price for gas at the field, even in increasing amounts through the years?

A. Yes, sir, in arriving at my values, yes; not in any profit and loss statements, Mr. Fitzhugh. It seems that we are talking about two entirely different things.

Q. Well, Mr. Hulcy, do you understand how this whole thing works out, as Mr. Freese has described it in his testimony?

A. In connection with the production system property?

Q. I say in connection with——

A. I didn't hear Mr. Freese's testimony in connection with that.

Q. In connection with taking care of the proper consideration for gas reserves.

A. No, I didn't hear him testify about that, Mr. Fitzhugh.

Q. Well, you don't know, then, do you, that his proposition has nothing to do with a profit and loss statement or with a balance sheet?

A. Mr. Fitzhugh, I do know, though—from this exhibit I [fol. 3522] know that he has eliminated over four millions of dollars of property; I know that he has eliminated $232,000.00 of operating expenses.

Q. Just take that four hundred millions of——

A. Four hundred million or four million?

Q. All right, four millions of property you are talking about.

A. Yes, sir.

Q. Didn't you eliminate the same property in your valuation, as it was worked out, over-all?

A. No, sir, I did not; no, sir.

Q. You took it out of your valuation——

A. Yes, sir; I said——

Q. —of gas reserves.

A. I said that the gas producing properties were the net value of the gas reserves——

Q. And Mr. Biddison——

A. —were worth the net value of the gas reserves, plus the equipment used; and it is just as broad as it is long, whether you don't include them all or whether you deduct them all.

Q. Well, the way your valuation works out, after all you fellows finally get together—you and Mr. Steinberger, and Mr. Biddison, and all the others that got into this thing,—after you come to the net result, don't you have a complete [fol. 3523] and absolute one hundred per cent elimination of the gas production equipment?

A. Well, it wasn't necessary to get together with anybody on that. All I wanted was the figure that was included in their appraisal for gas well equipment and construction, and that is the amount.

Q. Just answer the question.

A. No, sir, I didn't get together with anybody.

Q. Well, disregarding the getting together feature of it,—haven't you ended up with the whole thing eliminated?

A. I deducted from my gross value the gross recovery value.

Q. Every penny?

A. That they had in there for gas well equipment and gas well construction.

Mr. Griffith: Mr. Biddison evaluated gas well construction and gas well equipment, didn't he?

A. Yes, sir, he did.

Mr. Griffith: And it is included in Defendant's Exhibit 28?

A. Yes, sir, it is.

Q. And that is the exact amount you took out, too, isn't [fol. 3524] it?

A. Yes, sir, it is.

Q. So you just washed out?

A. No, sir, I didn't just wash out, Mr. Fitzhugh, at all.

Q. Well, if you put it in—if you take out and Mr. Biddison puts it in, where have you gotten?

A. Mr. Fitzhugh, the gas well equipment, gas well construction and gas reserves have a value. They are all included in the appraisal. I arrived at a figure, which I consider is the present fair value as at January 1, 1933, of the gas reserves owned by Lone Star Gas Company at that date, and, as I stated on my direct testimony, it was a mathematical calculation of the withdrawal value of property owned by the Company at that date.

Q. All right. Now, Mr. Hulcy, I believe you have testified heretofore that your gas is not worth any more than somebody else's gas in the same field?

A. I said that I assumed that, Mr. Fitzhugh. However, I did point out several reasons why it should be worth more, and why I thought I was treating it mighty conservatively.

Q. All right. Now, Mr. Freese, in his computation, allowed the full well-head price at the prevailing field price in every case, did he not?

[fol. 3525] A. Well, that is my understanding that he did.

Q. And for every cubic foot that was actually withdrawn for the period stated?

A. Well, now, my understanding is that that was based upon the deliveries—that is, by quarters. Of course, I didn't have the necessary information to check that all the way through, but I am sure that Mr. Freese was right—that is, in his calculations. I know of no reason for saying that they were not correct.

Q. Now, when you buy gas from another owner at the prevailing price in the field——

A. Yes, sir.

Q. —you don't have to pay that owner for a return on his investment, depreciation, dry hole expense, canceled and

surrendered lease expense, and all these other things, in addition to the price you pay him for his gas?

A. We usually pay him one price, which includes the cost of delivering the gas to us at the well-head.

Q. You don't have to pay any operating expenses to get that gas to the well-head, do you?

A. Not to get the gas to the well-head, no, sir; that is the producer's expense.

Q. And the prevailing price that you pay the owner covers [fol. 3526] all those things?

A. That is correct; and it should cover them.

Q. Now, if Mr. Freese goes on the same assumption that you have already made of considering your gas worth just the same as other owner's gas, why hasn't he been absolutely fair and just to you in every way?

A. Why, he has not been fair and just at all in the preparation of that exhibit, Mr. Fitzhugh, I don't think. I think right on the face of it, Mr. Fitzhugh, as I just stated, that when you eliminate over four million dollars worth of property owned and used and useful to the Company, and that when you deduct operating expenses that were actually incurred, and when these operating expenses alone are in excess of the total credits that you allow,—when you say that is fair and just, I can't follow you, that's all.

* * * * * * * *

[fol. 3527] Q. Mr. Hulcy, of the amount for operating expenses, which you say should not be eliminated in getting the gas to the well head, how much would be for cancelled and surrendered lease expense?

A. Included in the amount of $232,758.70 which I read into the record, of that amount $176,139.67 is set out to cover cancelled and surrendered leases as shown on page 1 of Plaintiffs' Exhibit No. 4.

Q. In other words, about 75 per cent. of that amount is cancelled and surrendered lease expense?

A. Yes, sir, 76 per cent.

Q. When was that money actually paid out, Mr. Hulcy?

A. I couldn't tell you when the cash was actually paid out on that, Mr. Figzhugh. That represents the value of an asset that was written off in the year 1933.

Q. And which expired some fifteen or twenty years ago, no doubt; did it not?

A. No, I don't think so. I don't think there are any leases included in that amount. I would say that all of these amounts, generally speaking, would be under five years. The only way a lease could be held for a period of twenty years usually would be through production, and any lease cancelled and/or surrendered on which we had secured production would not be charged to cancelled and surrendered leases; that would be charged against the reserve for depletion.

[fol. 3528] Q. Now, wasn't this an amount—wasn't this amount of expense an expense that was incurred in the development of about four billion cubic feet of gas reserves?

A. This had absolutely no connection whatever with the development of gas reserves.

Q. Why do you have cancelled and surrendered lease expense?

A. Well, that is caused by the fact, Mr. Fitzhugh, that the company sees fit and does purchase leases, and naturally all of the leases purchased by the company are not found to be good.

Q. Yes, sir.

A. Therefore it is necessary that the investment be relieved of this asset which has been placed upon the books through the cash expenditures of money, and as they are cancelled and/or surrendered that amount is charged as an operating expense; and this is the amount that Mr. Phillips in his Exhibit No. 4 has shown to be applicable to Texas operations or Texas properties.

Q. Can't you say, Mr. Hulcy, that cancelled or surrendered lease expense or cancelled and surrendered leases are just a sort of by-product in the development of gas reserves?

A. No, sir, I wouldn't say that at all. I would say that that is an actual expense incurred by the company. There is only one place to put it, it is gone, you don't have it, there are no reserves, there isn't anything else accrued on it, and the only place you have got to charge it is to expenses and [fol. 3529] the classifications used by the company have provided for that to be charged to operating expenses, and that has been done.

Mr. Griffith: You mean it is a classification of accounts.

A. Yes, sir, I do.

Q. Now, the company buys leases from time to time, don't they?

A. Yes, sir, they do.

Q. They develop those leases?

A. Some they do and some they don't.

Q. Some turn out to be bad ones and some turn out to be good ones?

A. Yes, sir.

Q. Now, don't you think, Mr. Hulcy, it is unfair to charge public service operations with the expense of getting all of those bad leases that are later charged off as cancelled and surrendered leases expense, unless you at the same time credit those public service operations with the increased value or the enhanced property value due to the development of some of the leases into good paying properties and into good gas reserves?

A. Now, if I follow your question, I will answer it to the best of my ability, Mr. Fitzhugh. As I stated a while ago, I don't think that cancelled and surrendered leases have any connection whatever with the value of gas reserves. As I stated, that is an operating expense which necessarily must be charged to expenses. The value placed on the gas [fol. 3530] reserves at any given date does not necessarily mean the enhancement in value. It also takes into consideration the doubled value of any particular lease which is included therein, and, of course, it does not give any consideration whatever to whether the final answer is in excess of the amount carried on the books or is below the amount carried on the books.

Mr. Griffith: By the term "carried on the books", you mean the actual cost of the property is carried on the books?

A. That is correct, yes, sir.

Q. Now, this four million four hundred thirty-two thousand dollars worth of property was the value of the gas producing properties, wasn't it?

A. Yes, sir, as shown on page 11, Plaintiffs' Exhibit No. 4—with the exception of such gas producing property as is included in the Petrolia field.

Mr. Griffith: It is cost rather than value, isn't it, Mr. Hulcy?

A. That is correct, too. This is the cost as reflected by the books and it is included in the statement prepared by Mr. Phillips.

Q. Why did you eliminate the Petrolia field?

A. Well, sir, the only reason I eliminated that, Mr. Fitz-

hugh, was that I wanted to arrive at a minimum value when I made the calculation which I read into the record this [fol. 3531] morning.

Q. In using your own computations for finding the value of gas reserves didn't you get to the negative value for the Petrolia field?

A. For the value of gas reserves, yes, sir.

Q. And isn't that the reason——

A. Understand, though, the negative value was not in excess of the property—the producing property—gas well construction and equipment carried for the Petrolia field.

Q. Well, the only reason you eliminated the Petrolia field is that it is at the present time a worthless field?

A. No, sir, that is not the reason. The main reason I eliminated it was because it was eliminated by Mr. Freese, and, as I said, the figure that I read into the record is a minimum figure; in fact, it does not include any of the net additions made to the gas producing properties for the year 1932 or the year 1933 on down to date in 1934.

Witness excused.

Mr. Griffith: That concludes our rebuttal testimony, if the Court please.

[fols. 3532-3533] Defendant rests.

* * * * * * *

[fol. 3534] S. W. Freese, recalled by plaintiffs, testified further as follows:

[fols. 3535-3536] Direct examination.

Questions by Mr. Fitzhugh:

Q. Mr. Freese, there has been considerable discussion in the rebuttal testimony put on by the company of your Exhibit 6. I will ask you, in order to make the matter clear, didn't you accept the quoted prices of pipe current as of the date of your appraisal?

A. Yes, although as far as I can make out, on any sizable purchases of pipe the Lone Star Gas Company has always obtained a discount from the quoted prices of from ten to fifteen per cent or more, and I have the list here with me

for some two million feet of pipe bought in 1929. We have used the quoted prices as of June 15, 1934 in our appraisal. Except on earth work we have used the same prices as set up by the company in their appraisal. Now, in between January 1, 1933, and June 15, 1934, there was an increase in the quoted prices of some $900,000.00. However, we did not feel that the allowances made in the company's exhibit for omissions and contingencies are in any way justified, and those omissions and contingencies just about offset the increase in pipe prices.

* * * * * * *

[fol. 3537] Q. Now, after all the points that have been raised here in Cross Examination and what has been said about overheads, are you still satisfied with those just exactly as you have them included in your Exhibit No. 6?

A. Yes; I think those are full and sufficient allowances for overheads.

Q. The company has had several witnesses to show the rate of attachment of customers on some four lines, I believe, and in several communities. Now, assuming that their data is true in every respect, Mr. Freese, does that have any bearing of the remotest sort upon going value?

A. No. Unless you know the earnings of those particular lines, whether they fully compensate for whatever idle plant there may be, or, more particularly, whether the earnings as a whole were sufficient to give a fair return on the investment in the property, and the history of the company shows that to be so from the beginning, there would be no logical reason for considering idle plant on any line.

Q. It was your testimony on Direct Examination, if I remember correctly, that you had evaluated the properties of the company as a going concern without the addition of a separate allowance for that item?

* * * * * * *

[fol. 3538] A. Yes.

Q. Well, that does represent the way you have treated going value?

A. It certainly does. We have included all overheads and everything necessary to make it a going concern.

Q. You say you have evaluated the properties as a going concern and included the allowances for going value with-

out making separate allowances, even after hearing all the rebuttal testimony of the company's witnesses?

A. The property has been evaluated by me as a fully going concern.

Q. Now, Mr. Phillips in his exhibit found a net value, or, rather, found a net amount for the Oklahoma gas, did he not?

A. That is correct.

Q. What was the amount that he found?

A. 132,000 cubic feet, approximately.

[fol. 3539] Q. Now, there has been some testimony here seeking to draw some conclusions as to whether that is a net figure or not. I will ask you, Mr. Freese, if you have made an independent investigation of your own with a view to finding the net figure for the Oklahoma gas?

A. Yes; I have made a check of that figure, and that 132,000 cubic feet is the correct figure for the net amount of gas produced in Oklahoma and used in Texas—and by net amount, if you deduct from the amount of gas purchased and produced in Oklahoma all of the gas used in Oklahoma, whether it comes from Texas or Oklahoma, and then deduct from that the amount of Oklahoma gas that went into storage at Petrolia, you will have 132,000 cubic feet left. In other words, if you simply trade gas between the two states and arrive at the net amount that came into Texas from Oklahoma, it is exactly 132,000 cubic feet—rather 132 thousand thousand cubic feet, or 132 million cubic feet.

Q. Now, Mr. Freese, you heard Mr. Hulcy's testimony, in which he interpreted the effect of your elimination of some four million dollars worth of producing properties of the Company. Now, I will ask you, Mr. Freese, if Mr. Hulcy correctly interpreted what you have done in that respect?

A. No. What we did do was to allow at the well head [fol. 3540] for every cubic foot of gas produced the prevailing well-head price for the gas—allow the Company just that same price that they paid everybody else. That was intended to include all of the costs which another producer selling it at the same price would include, and was intended to include a return on whatever value there was in the property being used by the producer of that gas, for the production of that gas, just like the well-head price would compensate the other owner for getting it to the well-head and

provide a return on whatever value was in the property itself.

Q. Did Mr. Hulcy understand what you had done in the handling of the operating expenses?

A. Well, I don't know whether he did or not.

Q. Did you include as a part of the operating expenses some 75 per cent for cancelled and surrendered leases?

A. No; I do not include any of the operating expenses in getting the gas to the well-head, any more than if you purchased gas from another owner you would make a separate allowance for any expense he had incurred in cancelled and surrendered leases and dry hole expense in getting that gas to the well-head.

Q. Now, Mr. Freese, did Mr. Connor, in testifying as to the interpretation he placed upon your testimony with reference to annual depreciation correctly interpret your theory on that?

A. No; he certainly did not. In so far as basic mor- [fol. 3541] talities are concerned, this Table 1 is correct, and I think I get a higher computed figure than Mr. Connor's own mortality curve showed. However, when it comes to major removals, what we did was to take an average of the 659 miles of major removals which had occurred during the history of the Company. A large part of those removals came at the very beginning of the Company's history, when their gas fields were not so certainly established and they were changing lines from one place to another. We have allowed the equivalent of 30 miles per annum, or 160,000 feet per annum. It was intended that that should have been allowed from the very beginning, particularly since in the beginning the major pipe removals were higher than now. We started out with that 659 miles, and if you apply it as we intended it should be applied, you would arrive back with the same 659 miles we started with, instead of 320.83. If that correction be made, then the total feet of 3-inch equivalent diameter pipe which would have been allowed for throughout the history of the Company would be almost exactly the amount of 5,854,774 feet which was actually incurred; and that will also throw off Table 5, which is based upon the same erroneous interpretation of our Exhibit 7.

Q. And of the general method that you used in the preparation of Exhibit 7?

A. That is correct.

[fol. 3542] Q. Now, the implication made by some of the company's witnesses as to your handling of the annual depreciation allowance as found by you is that you actually assumed that the Company would make use of the fifteen million dollar credit balance in its depreciation reserve? Did you actually do that, Mr. Freese?

A. No. We did not refer to this fifteen million dollars, which has been set aside for the purpose of making these replacements, or to take care of the pipe which is actually worn out in service during the history of the Company. What we did assume was that the Company had actually set aside a sufficient amount, whatever that amount might be, to take care of what had been worn out in the past history of the Company, and the annual allowance we did make is sufficient when taken along with the proper amount of reserve having been set aside to take care of the pipe that is worn out in the past, to make all replacements, and to fully amortize the pipe during its life cycle.

Q. Have you made a study of and reduced to a graphic representation a comparison of the computed mortalities as used by you in your mortality curve, and as used by Mr. Connor in his mortality curve, and as compared with the actual mortalities?

A. Yes, sir.

[fol. 3543] Q. Will you produce that, please, sir?

A. Yes, sir.

Q. And this exhibit prepared by you is entitled "Historic Replacements and Abandonments by Years of Lone Star Gas Company and Curve Showing Calculated Replacements and Abandonments"?

A. Yes.

Q. There appears on that sheet a curve labeled, "Hawley, Freese & Nichols Calculated Replacements and Abandonments"?

A. Yes, sir.

Q. And another curve entitled "Connor's Calculated Replacements and Abandonments"?

A. Yes, sir; that is correct.

Mr. Fitzhugh: We offer this sheet in evidence.

(Thereupon the sheet or graph referred to above was marked for identification as Plaintiffs' Exhibit No. 11.)

Q. Refer to your chart, Mr. Freese. Will you please make an explanation of what you show thereon?

A. The heavy line shows the calculated pipe mortalities as calculated by me.

The Court: The heavy curve?

A. The heavy curve, yes. The dotted curve shows the mortalities as taken from Mr. Connor's basic mortality [fol. 3544] curve. Now, up through the year 1931, and including the mortalities on Lines "J" and "C", which are represented by the cross-hatched section and the white section, these vertical lines represent graphically the actual mortalities or replacements experienced by the Company during each one of these years. Up through the year 1931 the actual mortalities—that is, the sum total of all these vertical lines, including the mortalities on "J" and "C", equal substantially the computed mortalities as computed both by Mr. Connor and by myself. During the earlier years I show a somewhat higher rate of calculated mortalities, and Mr. Connor shows a somewhat lower rate of calculated mortalities. But up through the year 1931 both curves and the actual experience were all in substantial agreement. Now, however, since these curves were prepard and were submitted before the Railroad Commission, we have had two further years of experience—1932 and 1933, and those have been plotted on this same curve. For the year 1932 I predicted some 62 miles of pipe replacement; Mr. Connor predicted some 85 miles of pipe replacement; and there was actually incurred some 6 miles of pipe replacement. For the year 1933 I predicted that there would be some 69 miles of pipe replacement; Mr. Connor predicted that the replacements would be 100 miles. Now, as a matter of fact, the actual replacements have been approximately 47½ miles.

Q. Is there any other explanation that needs to be made of this chart?

[fol. 3545] A. No; I think that covers it.

Q. Now, there was some criticism by rebuttal witnesses of you, Mr. Freese, for using piecemeal replacement costs. I will ask you if you actually did that?

A. No. What we did, in applying these percentages, was to use the same price for piecemeal construction as was arrived at in wholesale construction. Now, the reason we did that was because the salvage of the old pipe on the

piecemeal construction offsets the additional cost of installing the pipe over the wholesale construction cost; and the way I know that is true is by reason of the fact that for the several past years I have checked the actual charges to the depreciation reserve where these replacements have been actually charged up on the books of the Company, and have found that the wholesale reproduction cost of that pipe, or of those units of pipe as included in the replacements, and as found in both the Company's appraisal, and our appraisal, are in excess of the costs as actually incurred by the Company when the salvage value of the pipe has been taken into consideration.

Q. There was some comment made, Mr. Freese, as to the fact that you had estimated separately the time that would be required in putting together the Company's property into different sections. I will ask you if there was really any difference overall as to the assumption of a construction period as between yourself and Mr. Connor?

[fol. 3546] A. There was a great deal of difference in the net results. I got $1,500,000.00 plus for interest during construction. I don't know what Mr. Connor got. But if Mr. Connor had assumed that each unit of property would go into service, or rather, construction on any unit of property would not be started until there was some hope or promise of that piece of property, or unit of property, being used when it was finished,—then we would have arrived at exactly the same results, because the time periods I have allowed for the construction of each item of property are sufficient to take care of the actual construction time involved in the construction of the different parts of the property.

Q. And you have already read into the record the times that you have estimated for the various types of property?

A. No; I don't think I read that into the record; but the exhibit clearly shows the percentages I have allowed for each item of property, and the explanation which I made before will show just how it is arrived at for each item of property.

Q. For instance, in the matter of Compressor Stations, was that one of the things mentioned?

A. Yes, sir.

Q. How did you handle the time for the building of Com-

pressor Stations in the finding of Interest During Construction?

A. We allowed for a 10-month period for the building of Compressor Stations.

[fol. 3547] Q. Now, I show you this exhibit of Mr. Hulcy's, on Pipe Purchases, being Defendant's Exhibit No. 51. Do you have a copy of that?

A. Yes.

Q. I will ask you, Mr. Freese, if you use a single price appearing anywhere in this exhibit in your present appraisal?

A. No. This was with reference to the appraisal presented before the Railroad Commission, and the prices herein used are very substantially lower than the prices used in this appraisal. What we attempted to do at that time was to determine the actual price that the Lone Star Gas Company was paying for pipe, and to use that price as heretofore explained; in this appraisal, we have used the quoted prices, although the Company has always obtained a discount off the quoted price for any considerable amount of pipe construction.

Q. And where in the columns entitled "Freese's Price F. O. B. Mill", on both sheets of this exhibit, the prices there stated apply only to the prices used by you in testifying before the Railroad Commission about a year ago?

A. Yes; for an appraisal as of date two and a half years ago.

Q. And where in the columns entitled "Quotation F. O. B. Mill", in each page of this exhibit, I will ask you if those are not about the same as the prices used by the Company [fol. 3548] before The Railroad Commission?

A. They have always used the quoted prices in their appraisals, both before the Railroad Commission and here in this present appraisal.

* * * * * * *

[fol. 3549] Q. You have stated into the record, have you not, Mr. Freese, some examples of purchases actually made by the company of pipe recently?

A. Yes, the only large purchase which the company has made recently; that is correct.

Q. Since that purchase, has there been any other sizable purchase of pipe that you know of?

A. No.

Q. That would be a gauge of the price actually now being paid by the company?

A. No, and I must say that although the discount there was some 33⅓ per cent, in view of the explanation of that matter which Mr. Schmidt made this morning, I think possibly that was distress pipe prices; whether they would have gotten a ten or twelve per cent discount, I don't know, had it not been for the nature of the transaction he described.

Q. Now, in your Exhibit No. 8, Mr. Freese, where you summarize the effect of the application of a thirty-two cent domestic gate rate, after making corrections to normal temperatures for the years ended December 31, 1933, and March 31, 1934, and where you find that with that correction being made, the return on a rate base or a value of $40,256,862.39 would work out, for the year ended March 31, 1934, in an amount of 6.74 per cent, and for the year ended December 31, 1933, in an amount of 6.76 per cent, I will ask you if, after hearing all the points raised in this rebuttal testimony, you have changed your opinion as to [fol. 3550] that testimony?

A. There should be a correction of four-hundredths per cent. In other words, from this 6.74 and 6.76, the 6.74 should be corrected to 6.70 and the 6.76 per cent corrected to 6.72 per cent, by reason of the fact that the allowance we had made for current replacements on compressor stations should have been increased. With that exception, or after having taken that into consideration, we feel that the return set out on page 1 of that exhibit 8 is correct.

Q. And to sum up the whole thing, Mr. Freese, if value is found as you have found it, and if the year is adjusted to make an average year as to temperature, as disclosed on the first page in Exhibit 8, the company, through the year 1933 and 1934 will make substantially in excess of six per cent, will it not?

A. Yes—or rather, through the year ending March 31, 1934, they would have made substantially in excess of six per cent.

Q. That's all.

Cross-examination.

Questions by Mr. Griffith:

Q. That is upon the property as you evaluated it?

A. Yes, and as the company evaluated the physical properties, except for excavation.

Q. And with the exclusion by you of all of the production system property of the company located in the State of Texas?

A. No. We allowed, as to your own production properties, for every cubic foot of gas purchased, or rather, pro- [fol. 3551] duced by you, every cent that gas was worth, and every cent that you would pay anyone else, and it was the current and prevailing price in the respective field where the gas was produced.

Q. Did you exclude from your evaluated figure of property, each and every dollar that the company had invested in its production system property in the State of Texas?

A. It is not included as an item in the $40,256,862.39, but a return on that property is allowed in the $232,644.75 in the first column, and the $212,031.46 in the second column on page 1 of Exhibit 8.

Q. Not only that, but in Plaintiffs' Exhibit 8, you actually excluded out of pocket operating expenses, actually paid by the Lone Star Gas Company in its regular operations, in the amount of $232,000.00, didn't you, covering the production system property for the year 1933?

A. I didn't do any such a thing. Those were not actual out of pocket operating expenses; the actual out of pocket operating expenses were about $70,000.00.

Q. Didn't cancelled and surrendered lease expense represent out of pocket expense to the company?

A. In other years; it was expense which might have been involved in connection with the development of the 200 million thousand feet of gas in other years, whereas there was only five million thousand used in that year.

Q. Your responses to my questions have a familiar ring, Mr. Freese. Were you responsible for the questions which [fol. 3552] were propounded to Mr. Hulcy in that connection?

The Court: I don't think it would be material; they were asked.

Q. Did you make any historical study or actual study as to the historical attachment of business to major transportation lines as shown in Defendant's Exhibit 48, prepared by Mr. Ed C. Connor?

A. No, the only historical study I made of the company's business was to determine for myself whether the company had made a fair return on its property from the very beginning or not.

Q. So far as you know, is the historical rate of business attachment as set forth in Defendant's Exhibit 48 correct?

A. I think it is correct.

* * * * * * *

[fol. 3553] Q. Now, Mr. Freese, in any calculation of mortalities as set forth in a mortality curve, will it be found that actual experience of the units will conform exactly to the mortality curve?

A. No, they will not conform exactly to the mortality curve, and I think that is well illustrated by the curve which I gave to the jury a minute ago.

Q. As a matter of fact, replacements and removals come at irregular intervals, do they not?

A. Yes, they most certainly do.

Q. And all that the curve is intended to show is the general trend of replacements?

A. That is correct.

Q. Now, will you refer, please to page 21 of your Exhibit 6?

A. Yes, sir.

Q. What do you show as the value of the B system, based upon your appraisal?

A. $3,188,121.55 for the transmission line equipment on the B system.

Q. How many dollars out of that $3,188,121.55 represent going value, going concern value or cost of reproducing the business?

A. None of the overheads are included in that figure of [fol. 3554] $3,188,121.55, but that figure, taken together with the overheads, represents the value of that pipe line as a going pipe line.

Q. Mr. Freese, I want you to take your Exhibit 6, and point out to me where, in connection with any item of prop-

erty, you have allowed so much as one dollar for going value, going concern value or cost of reproduction of the company's business.

A. Every dollar in Exhibit 6 represents the value of property in a going concern. If it were not a going concern, and if it was not used and useful, it would not be in there.

Q. Mr. Freese, can you identify or segregate a single dollar in connection with any of the property set forth in Plaintiffs' Exhibit 6, and which dollar represents your evaluation of going value, going concern value, or the cost of reproducing the company's business?

A. As I answered your previous question, every dollar in there represents the value of property as part of a going concern.

Q. Mr. Freese, don't you say in connection with Plaintiffs' Exhibit 6, that this is the cost of the reproduction of the property, the Texas gathering, transmission, compressing and general property?

A. That is correct.

Q. Is that title a misnomer?

A. No.

Q. Well, if the title is to be taken as it reads, where have you included any allowance for going value, going concern value or cost of reproducing the business?

[fol. 3555] A. Mr. Griffith, I have not separately labeled a certain amount of dollars as going value. Every item included in there is property, as part of a going concern. Furthermore, in addition to that, in the operating expenses which we have allowed, we have allowed for the attachment of new business, the securing of new business, advertising expenses, and every expense that would be incurred in the nature of attracting new business and which is one of the things which ordinarily, and which does, go to make up what is known as going value.

Q. Now, we may get to the profit and loss statement, later, Mr. Freese, but please confine yourself to this reproduction cost evaluation at this time. Can you point out to me a single dollar in here or a series of dollars which represents going value, going concern value or the cost of reproduction of the business as distinguished from the cost of reproduction of the property?

A. Not separately labeled as such, no.

Q. If the property of the company were to be reproduced

as of June 15, 1934, and there was no business attached whatsoever, wouldn't your reproduction cost be the same as set forth in Plaintiffs' Exhibit 6?

A. Yes, and that would be true whether it was 100 per cent saturation or whether there was no saturation at all, in view of the history of the company, the way it was actually produced and the way it could be produced from the beginning again. There was no loss of return on idle plant [fol. 3556] during the history of the Lone Star Gas Company.

Redirect examination.

Questions by Mr. Fitzhugh:

* * * * * * *

Q. Mr. Freese, where you spoke there about saturation, are you making the assumption that Mr. Griffith evidently intended, of no customers? I don't believe that you got his question.

A. Apparently my answer is not clear there. What I did mean to say is this: That in view of the history of the [fol. 3557] company and the way the business was attached or developed, and the way the business could be developed again if it were reproduced, that we have not taken into consideration or had to take into consideration the per cent of saturation.

* * * * * * *

Mr. Fitzhugh:

Q. Now suppose, Mr. Freese, in the matter of the B system, where you found a reproduction value of the amount $3,188,121.55, that this line had had no customers attached or had no operating personnel to operate it, but was simply laying there as a static line. What value would you have given it?

A. Well, if it was not used and useful, it would not have any value at all, as a part of the public service property of the company.

Q. No value.

Mr. Griffith: The property's reproduction cost would be the same, wouldn't it, Mr. Freese?

A. No, not the reproduction cost new of the used and useful property of the Lone Star Gas Company. We left out of our appraisal the Petrolia Field, because the company was suffering an out of pocket loss every year in that field, and there was nothing but junk value there. We did, however, allow the salvage value of the field line equipment in [fol. 3558] that Petrolia field, for that reason.

Mr. Fitzhugh: And the same concept applies just as well to the individual lines or the B system of the company or any other part of the system as a whole, as to the Petrolia field, doesn't it, Mr. Freese?

A. Yes, it does.

Mr. Fitzhugh: We rest.

The Court: Plaintiff closes his case.

Mr. Griffith: The defendant rests, if the court please.

The Court: Both sides are through, gentlemen?

Mr. Griffith: Yes.

* * * * * * *

[fol. 3559] (Thereupon at 5:00 o'clock p. m., Thursday, July 12, 1934, evidence was closed.)

[fol. 3564] PLAINTIFFS' EXHIBIT No. 2

IN THE DISTRICT COURT OF THE UNITED STATES FOR THE WESTERN DISTRICT OF TEXAS, AUSTIN DIVISION

In Equity. No. 467

LONE STAR GAS COMPANY, Plaintiff,

vs.

RAILROAD COMMISSION OF TEXAS et al., Defendants

On this 11th day of November, A. D. 1933, came on to be heard the application of Lone Star Gas Company, plaintiff for an interlocutory injunction in the above styled and numbered cause, before a court of three judges duly called

and assembled pursuant to the provisions of Section 266 of the Judicial Code of the United States, as amended. Whereupon the defendants Lon A. Smith, C. V. Terrell and E. O. Thompson, the members of and constituting the Railroad Commission of Texas, and James V. Allred Attorney General of the State of Texas, presented a motion for stay of proceedings herein; and

It appearing to the Court from the motion of the said defendants for stay of proceedings herein, that the said defendants together with the State of Texas had as plaintiffs instituted a suit against Lone Star Gas Company, the plaintiff herein, as defendant in Docket No. 53033 in the Fifty-third Judicial District Court of Travis County, Texas, to restrain and enjoin the violation by Lone Star Gas Company of the terms, provisions and requirements of an order, [fol. 3565] Exhibit A in plaintiff's bill of complaint herein, entered by the Railroad Commission of Texas on September 13th, 1933, fixing and prescribing rates to be charged for natural gas and natural gas service by Lone Star Gas Company at the city gates of numerous towns, cities and communities in the State of Texas and that such suit involves the validity of said order of the Railroad Commission of Texas; and

It further appearing to the Court from said motion to stay all proceedings herein, that upon a motion of the State of Texas and the defendants herein, Lon A. Smith, C. V. Terrell and E. O. Thompson, the members of and constituting the Railroad Commission of Texas, and James V. Allred, Attorney General of the State of Texas, filed by them as plaintiffs in said cause No. 53033 on the docket of the Fifty-third Judicial District Court of Travis County, Texas, the said State Court did on the 5th day of October, 1933, enter an order staying all proceedings against the plaintiff herein, Lone Star Gas Company, either under the terms, provisions and requirements of the Railroad Commission's said order of date September 13th, 1933, or under the rules and regulations of the Railroad Commission of Texas or under any law of this State, pending the final determination of said suit in the Fifty-third Judicial District Court of Travis County, Texas, and which said stay order restrains the Railroad Commission of Texas, the individual members thereof, the attorney General of Texas and all other officials and employees of the State of Texas or of the Railroad Commission or of any other State department, and all other

persons, from instituting or prosecuting any proceeding [fol. 3566] against plaintiff herein, Lone Star Gas Company, under said order of said Railroad Commission; or from attempting to enforce the duties, obligations and requirements imposed upon plaintiff herein by said order or by the rules and regulations of the Railroad Commission of Texas, or by any law of this State, whether by suit for mandamus, mandatory injunction, injunction, penalties, damages, quo warranto, forfeiture or receivership, pending a decision by the said Fifty-third Judicial District Court of Travis County, Texas, of the constitutionality of said order; and restraining all said State officials and departments and their employees and all other persons from enforcing or attempting to enforce the provisions of said order against Lone Star Gas Company, plaintiff herein, until the final determination by said Fifty-third Judicial District Court of Travis County, Texas, of cause No. 53033 on the docket of said court; and that said order provides that plaintiff herein, Lone Star Gas Company, shall not be subjected to any penalties, damages or forfeitures on account of the failure of said plaintiff herein to comply with the terms and provisions of the said order of the Railroad Commission of Texas entered on September 13th, 1933, or on account of any provisions of the Statutes of the State of Texas where such failure to comply with the law has taken place or takes place before the final determination of said cause No. 53033 on the docket of said District Court; and

The defendants Lon A. Smith, C. V. Terrell and E. O. Thompson, the members of and constituting the Railroad Commission of Texas, and James V. Allred, Attorney General of the State of Texas, having announced in open court by and through Elbert Hooper, First Assistant Attorney [fol. 3567] General of the State of Texas, counsel of record for said defendants and by whom said defendants appeared in this Court, that the said defendants and the State of Texas, and each and all of them, did not desire to enforce and had no intention of enforcing or attempting to enforce against the plaintiff herein, Lone Star Gas Company, any of the pains, penalties or forfeitures provided for by law by reason of any violation by Lone Star Gas Company of the terms, provisions and requirements of said order, committed or done by said plaintiff herein at any time before the final determination of said cause No. 53033 on the docket of the Fifty-third Judicial District Court of Travis

County, Texas, and that said order entered in the State Court was to be construed as suspending the operation of the said order of the Railroad Commission pending the final determination of said cause; and said Assistant Attorney General of the State of Texas, for said defendants, herein announced in open court that said defendants would consent and agree to an injunction by this Court entered in this cause, restraining said defendants, and each of them, from at any time enforcing or attempting to enforce against the plaintiff herein, Lone Star Gas Company, any of the pains, penalties or forfeitures which may arise or accrue because of or by reason of any violation of the terms, provisions and requirements of said order by plaintiff herein, committed or done herein by the plaintiff, Lone Star Gas Company, at any time prior to final determination of said cause No. 53033 on the docket of the Fifty-third Judicial District Court of Travis County, Texas; and

It appearing to the Court that by reason of said stay order in said cause No. 53033 in the Fifty-third Judicial [fol. 3568] District Court of Travis County, Texas, and by reason of the aforesaid statements of the said defendants herein in open court, by and through Elbert Hooper, First Assistant Attorney General, that the plaintiff herein, Lone Star Gas Company, is fully protected from the imposition of any and all pains, penalties and forfeitures provided by law and arising by reason of the violation by Lone Star Gas Company, plaintiff herein, of any of the terms, provisions and requirements of the said order of the Railroad Commission of Texas of date September 13th, 1933, done at any time prior to the final determination of said cause No. 53033 on the docket of the Fifty-third Judicial District Court of Travis County, Texas, and that upon the entry of an interlocutory injunction in this cause in compliance with the consent statements of said Assistant Attorney General, Elbert Hooper, and of the stay order of this Court, the requirements of Section 266 of the Judicial Code of the United States, as amended, will be complied with:

It is, Therefore, Ordered, Adjudged and Decreed that the defendants Lon A. Smith, C. V. Terrell and E. O. Thompson, being the members of and constituting the Railroad Commission of Texas, and their respective successors in office and all of the assistants, agents, attorneys and representa-

tives of the said defendants be, and each of them is hereby restrained and enjoined from enforcing or attempting to enforce, or from giving any effect to, by any means or methods, the said order of the Railroad Commission of Texas dated September 13th, 1933, directed against the plaintiff, Lone Star Gas Company, or any of the pains, penalties or forfeitures provided by law for any such violation of an order [fols. 3569-3571] of said Commission by reason of the violation of any of the terms, provisions and requirements of said order, committed by plaintiff, Lone Star Gas Company, at any time prior to the final judgment in said cause No. 53033 on the docket of the Fifty-third Judicial District Court of Travis County, Texas.

It is Further Ordered that all proceedings in this cause shall be stayed in this Court pending the final determination of cause styled The State of Texas et al. vs. Lone Star Gas Company, No. 53033 on the docket of the Fifty-third Judicial District Court of Travis County, Texas.

To the foregoing action of the Court in ordering a stay of all proceedings in this cause in this Court pending the final determination of said cause styled The State of Texas et al. vs. Lone Star Gas Company on the docket of the Fifty-third Judicial District Court of Travis County, Texas, the plaintiff took its exception in open court and such exception was allowed.

It is Further Ordered, however, that jurisdiction is hereby retained in this Court to enter such order and further orders upon the motion of either party as may be necessary to protect the jurisdiction of this Court or to protect the rights of any party herein.

Joseph C. Hutcheson, Jr., United States Circuit Judge. William I. Grubb, United States District Judge. T. M. Kennerly, United States District Judge.

[fol. 3572] PLAINTIFFS' EXHIBIT NO. 3

IN THE DISTRICT COURT OF TRAVIS COUNTY, TEXAS, 53RD JUDICIAL DISTRICT

No. 53,033

THE STATE OF TEXAS et al.

v.

LONE STAR GAS COMPANY

STIPULATION

Be it Remembered, that in the above styled and numbered cause, as a part of the evidence introduced by the State of Texas et al., in making out its case, in chief, and directly in the first instance;

It is Agreed by the undersigned counsel of record, representing all parties to this cause, that the defendant, Lone Star Gas Company, is still charging and collecting the forty cent rate, rather than the thirty-two cent rate, provided for in the order of the Railroad Commission, bearing date of September 13th, 1933; that said thirty-two cent rate has never been put in force or effect by said defendant, at any time, and that said forty cent rate has been collected continuously at all times, since the date of the order promulgated and adopted by the Railroad Commission of Texas, on September 13th, 1933.

Witness our signatures on this 11th day of June, A. D. 1934.

For the State of Texas et al., William C. Fitzhugh, Assistant Attorney General; A. R. Stout, Assistant Attorney General. For the Defendant, Lone Star [fols. 3573-3576] Gas Company, Thompson & Barwise, Karl F. Griffith, Ben H. Powell, Roy C. Coffee, Marshall Newcomb, Attorneys for the Defendant, Lone Star Gas Company.

[fol. 3699] PLAINTIFFS' EXHIBIT No. 10

[fol. 3700] THE STATE OF TEXAS,
County of Tarrant.

Know All Men by These Presents:

That We, I. H. Kempner, L. B. Denning, H. C. Edrington, W. P. Gage, and J. W. Ricker, do herein and hereby organize ourselves, our associates, and successors into a corporate body, under the General Laws of the State of Texas, to do a gas business, and for purposes hereinafter more fully explained.

I

The name of this corporation shall be: "Lone Star Gas Company."

II

The purpose for which this Company is organized is to "buy, sell, and furnish oil and gas for light, heat, and other purposes; to lay down, construct, maintain, and operate pipe lines, tanks, pump stations, connections, fixtures, storage houses, and such machinery apparatus, devices, and arrangements as may be necessary to operate such pipes and pipe lines between different points in this State; to own, hold, use, and occupy such lands, rights-of-way, easements, franchises, buildings, and structures as may be necessary to the purpose of this corporation."

[fol. 3701]

III

The business of this Company is to be, and shall be, transacted in Fort Worth, Tarrant County, Texas, (Ft. Worth being its principal office) but it will also do business, and maintain offices, in Wise County, Montague County, and Clay County, Texas.

IV

This corporation is organized to exist for the term of Fifty Years from the date of the filing and approval of this charter.

V

The Directors of the Company for the first year shall be five (5) in number, and consist of the following named persons, To-wit:

I. H. Kempner, of Galveston, Galveston County, Texas.
H. C. Edrington, of Ft. Worth, Tarrant County, Texas.
L. B. Denning, of Wellston, State of Ohio.
W. P. Gage, of Beaumont, Jefferson County, Texas.
J. W. Ricker, of Wichita Falls, Wichita County, Texas.

VI

The amount of the capital stock of this corporation is fixed at Two Million Five Hundred Thousand ($2,500,000.00) Dollars, divided into shares of One Hundred ($100.00) Dollars each, of par value; twenty-five thousand (25,000) shares being the total authorized issue of capital stock.

[fol. 3702]

VII

We, the undersigned, present this Charter and pray that the same be filed in the office of the Honorable Secretary of State of the State of Texas.

Witness our hands, this, the Third Day of June, 1909.

L. B. Denning. W. P. Gage. J. W. Ricker.

THE STATE OF TEXAS,
County of Dallas.

Before me, the undersigned authority, on this day personally appeared L. B. Denning, W. P. Gage, and J. W. Ricker, all well known to me to be the persons whose names are subscribed to the foregoing instrument, and they each acknowledged to me, that they had executed the same for the purposes and considerations therein expressed.

Given under my hand and seal of office, this, the 3rd Day of June, 1909.

M. A. Sepley, Notary Public, Dallas County, Texas.
(Seal.)

[fol. 3703] [Endorsed:] 20298. "Lone Star Gas Company." Charter. Fort Worth. Cap. Stock $2,500,000. Filing Fee $2540. Franchise $875. Remarks, 25000 shares, 50 yrs., $1,250,000 pd. in. C. 10-8. Filed in the Office of the Secretary of State this 4 day of June, 1909. W. B. Townsend, Secretary of State.

[fol. 3704] THE STATE OF TEXAS,
County of Dallas.

L. B. Denning, W. P. Gage, and J. W. Ricker, all being duly sworn, depose and say, as follows, To-wit:

I

That they are each interested in the organization of the "Lone Star Gas Company", and that they are the identical persons whose names appear in the Charter of said Company as Directors along with I. H. Kempner and H. C. Edrington.

II

Affiants further say, that all of the capital stock, to-wit: Two Million Five Hundred Thousand Dollars ($2,500,000), as provided for in the Charter of said "Lone Star Gas Company" has been, in good faith, subscribed for, and one-half thereof has been fully paid for, as hereinafter explained.

III

The names, place of residence, and Post-Office address of each subscriber for said shares of capital stock that have been paid in, and is now in the hands of the Board of Direcoors mentioned in the Charter is, as follows to-wit:

Treat & Crawford, of Pittsburgh, Pa., Amount paid in	$500,000.00
H. C. Edrington, of Ft. Worth, Texas, Amount paid in	$375,000.00
I. H. Kempner, of Galveston, Texas, Amount paid in	100,000.00
G. W. Crawford, of Pittsburgh, Pa., Amount paid in	150,000.00
L. B. Denning, of Wellston, Ohio, Amount paid in	$115,000.00
W. P. Gage, of Beaumont, Texas, Amount paid in	$5,000.00
J. W. Ricker, of Wichita Falls, Tex., Amount paid in	$5,000.00
Total Amount of capital stock paid for at par	$1,250,000.00

[fol. 3705]

IV

That the subscription to said capital stock above referred to was paid in cash by I. H. Kempner, by G. W. Crawford, by L. B. Denning, by J. W. Ricker, and by W. P. Gage.

V

That the subscription of Treat & Crawford, of Five hundred Thousand ($500,000.00) Dollars was paid in to the Company, as follows:

By them executing a good and sufficient Deed of Conveyance, transferring the natural gas, and the natural gas rights to about Forty One Thousand (41,000) acres of land located in Clay and Archer Counties, Texas, and a considerable part thereof located near Petrolia, or in the proven gas field of Clay County, Texas; that said property so conveyed by Treat & Crawford is of the actual value to the Company at which it was taken; that is, affiants say, that each and all of them are familiar with the property transferred to the Company by Treat & Crawford, the same above described, and that the cash value of such property is, in the opinion and to the best of the knowledge and belief of each, and all the affiants, Five Hundred Thousand ($500,000.00) Dollars, and is of the kind and character of property that will be needed and can be profitably used and handled by the Company.

VI

Affiants further show, that the subscription of H. C. Edrington to the capital stock of the "Lone Star Gas Company", to the amount of Three Hundred and Seventy-five Thousand ($375,000.00) Dollars was paid for by him executing a Conveyance to two (2) large, valuable, natural gas wells and part interest in three others located near Petrolia, in Clay County, Texas, and the natural gas right to a large acreage of land tributary thereto, and to the pipe lines conveying said natural gas from the wells in the [fol. 3706] field to the town of Petrolia; and then to the pipe line and all appurtenances, Right-of-way, etc., extending from the gas field to the town of Wichita Falls; and also the Right of Way giving the right to lay gas pipes and

erect thereon telegraph and telephone lines, and at all times, have ingress and egress thereto on a line extending from the gas field through Clay County, Montague County, Wise County, and Tarrant County, into the City of Ft. Worth, and which property so conveyed by said H. C. Edrington for said capital stock is, to the best of the knowledge and belief of affiants, of the cash value to the Company of the amount at which it was taken, as above explained.

VII

The capital stock of the "Lone Star Gas Company", to the extent of One Million Two Hundred and Fifty Thousand ($1,250,000.00) Dollars that has not yet been paid for, has been subscribed for by the following persons:

Treat & Crawford, of Pittsburgh, Pa., for	$650,000.00
H. C. Edrington, of Ft. Worth, Texas, for	$350,000.00
L. B. Denning, of Wellston, Ohio, for	$100,000.00
J. W. Ricker, of Wichita Falls, Tex., for	$75,000.00
W. P. Gage, of Beaumont, Texas, for	$75,000.00
Total Stock subscribed but not paid for	$1,250,000.00

Witness our hands, this the 3rd day of June, 1909.
L. B. Denning. W. P. Gage. J. W. Ricker.

Sworn to and Subscribed before me by L. B. Denning, W. P. Gage, and J. W. Ricker, on this, the 3rd day of June, 1909. M. A. Sipley, Notary Public, Dallas Co., Tex. (Seal.)

[fols. 3707-3708] STATE OF TEXAS,
County of Travis.

L. B. Denning, being duly sworn, deposes and says, as follows, to wit:

That he is interested in the organization of the "Lone Star Gas Company", and that he is the same person whose name appears in the charter of said Company as a director along with I. H. Kempner, H. C. Edrington, W. P. Gage, and J. W. Ricker;

That he is, and has been for more than seven years, acquainted with, and a business representative of, Treat

& Crawford, of Pittsburg, Pa., who are the same persons whose names appear as subscribers for the capital stock of said Gas Company;

That said firm of Treat & Crawford is a partnership consisting of Milo C. Treat, whose place of residence is in the City of Washington, State of Pennsylvania, and George W. Crawford, whose place of residence is in the City of Pittsburg, State of Pennsylvania;

That the office and place of business of said Treat & Crawford is located at 2017, Farmers Bank Building, in the City of Pittsburg, State of Pennsylvania;

That the interest of said Milo C. Treat and George W. Crawford in the capital stock subscribed for and paid in by them is as follows:

To Milo C. Treat, the undivided one-half interest of $500,000, or $250,000.

To Geo. W. Crawford, the undivided one-half interest of $500,000, or $250,000.

That the interest of the said Milo C. Treat and George W. Crawford in the capital stock of said Company subscribed but not yet paid for, is as follows:

To Milo C. Treat, the undivided one-half interest of $650,000, or $325,000.

To Geo. W. Crawford, the undivided one-half interest in $650,000, or $325,000.

Witness my hand, this the 4th day of June, A. D. 1909.

L. B. Denning.

Sworn to and subscribed before me by L. B. Denning on this the 4th day of June, 1909. Fred C. Wolfe, N. P. Notary Public Travis County, Texas. (Seal.)

(Here follows 1 photolithograph, side folio 3709).

[fols. 3710-3712] DEFENDANT'S EXHIBIT NO. 1

[fol. 3713] IN THE DISTRICT COURT OF THE UNITED STATES FOR THE WESTERN DISTRICT OF TEXAS, AUSTIN DIVISION

In Equity. No. 467

LONE STAR GAS COMPANY, Plaintiff,

vs.

THE RAILROAD COMMISSION OF TEXAS, LON A. SMITH, C. V. Terrell and E. O. Thompson, Said Persons Being the Members of and Constituting the Railroad Commission of Texas; James V. Allred, Attorney General of the State of Texas; Community Natural Gas Company, Municipal Gas Company, Texas Cities Gas Company, County Gas Company, the Dallas Gas Company, Waxahachie Gas Company, and Gainesville Gas and Electric Company, Corporations, Defendants

BILL OF COMPLAINT

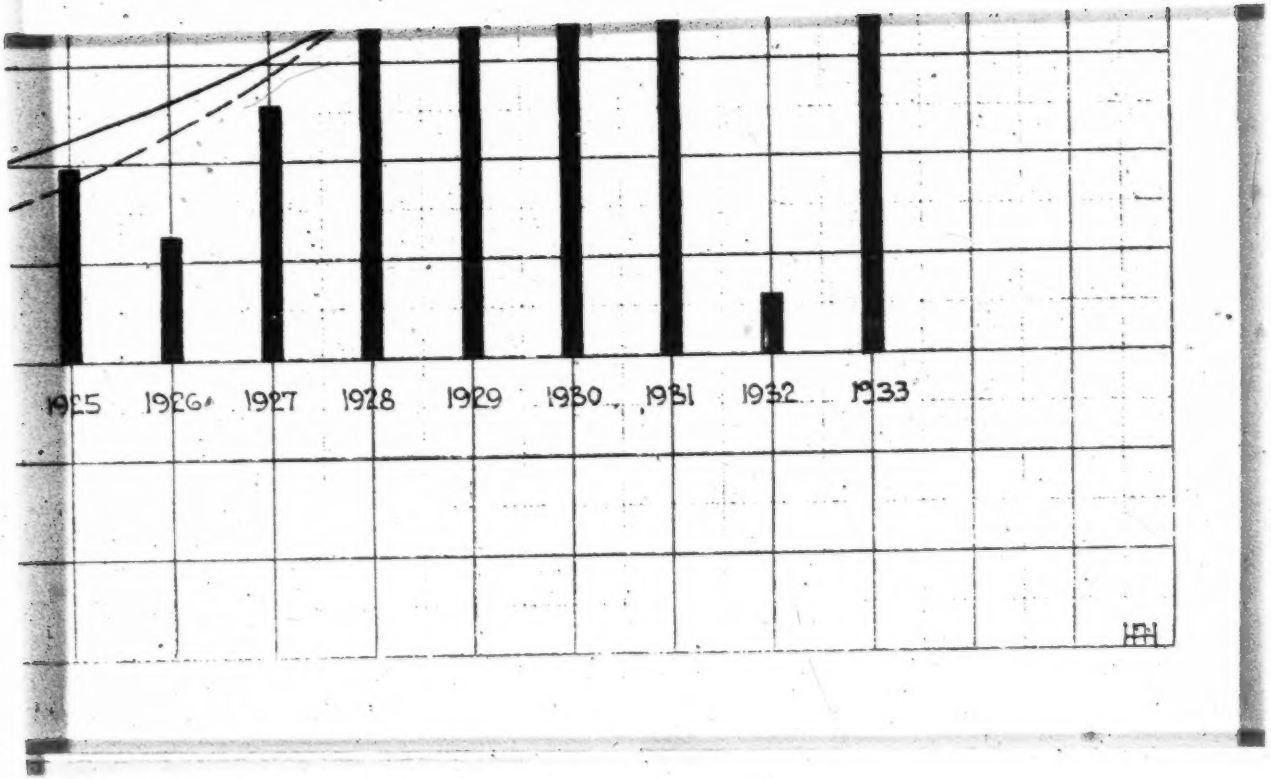
To the Judges of the District Court of the United States for the Western District of Texas:

Lone Star Gas Company, Plaintiff, brings this its Bill of Complaint, against the following Defendants: The [fol. 3714] Railroad Commission of Texas, Lon A. Smith, C. V. Terrell and E. O. Thompson, said persons being the members of and constituting the Railroad Commission of Texas; James V. Allred, Attorney General of the State of Texas; Community Natural Gas Company, Municipal Gas Company, Texas Cities Gas Company, County Gas Company, the Dallas Gas Company, Waxahachie Gas Company, and Gainesville Gas and Electric Company.

For cause of action the Plaintiff alleges:

I

Plaintiff Lone Star Gas Company is a corporation, duly incorporated, created and existing under and pursuant to the laws of the State of Texas, having its principal office and domicile in the City of Dallas, County of Dallas, State of Texas, and in the Northern District of Texas, Dallas Division; and is a corporate citizen, resident and inhabitant



1925
1926
1927
1928
1929
1930
1931
1932
1933

of the State of Texas and of the United States and of the Northern District of Texas.

II

The Defendants Lon A. Smith, C. V. Terrell and E. O. Thompson are each duly elected members of and are the persons constituting the Railroad Commission of Texas. The Railroad Commission of Texas is an administrative or legislative board or commission of the State of Texas and has certain powers relating to the regulation of the [fol. 3715] rates of public utilities engaged in the natural gas business, said powers and duties being defined by Articles 6050 to 6066 of the Revised Civil Statutes of Texas, 1925. These said Defendants, purporting to act under the power and authority conferred upon them by law, have entered the Order herein complained of.

The Defendant James V. Allred is the duly elected, qualified and acting Attorney General of the State of Texas and is charged with the general power and duty of carrying out and enforcing the laws of said State, and the orders and acts of the Railroad Commission of Texas, and particularly the Order herein complained of.

All of the foregoing Defendants are citizens, inhabitants and residents of the State of Texas and of the United States and, so the Plaintiff is informed and believes, of the Western District of Texas.

III

(a) The Defendant Community Natural Gas Company is a corporation duly organized and existing under and by virtue of the laws of the State of Delaware, with its principal office at 100 West 10th Street in the City of Wilmington, New Castle County, Delaware. During all of the times herein alleged the said Defendant has continuously been qualified, and is now duly qualified, to do and conduct its corporate business in the State of Texas under a permit duly issued to it by the Secretary of State of the State of Texas. Said Defendant has and maintains an office in the [fol. 3716] City of Dallas, Dallas County, Texas, and in the Northern District of Texas.

(b) The Defendant Municipal Gas Company is a corporation duly organized and existing under and by virtue of the laws of the State of Texas, with its principal office

and domicile in the City of Dallas, Dallas County, Texas, and is a corporate citizen, inhabitant and resident of the State of Texas and of the United States and of the Northern District of Texas.

(c) The Defendant Texas Cities Gas Company is a corporation duly organized and existing under and by virtue of the laws of the State of Texas, with its principal office and domicile in the City of Dallas, Dallas County, Texas, and is a corporate citizen, inhabitant and resident of the State of Texas and of the United States and of the Northern District of Texas.

(d) The Defendant County Gas Company is a corporation duly organized and existing under and by virtue of the laws of the State of Texas, with its principal office and domicile in the City of Dallas, Dallas County, Texas, and is a corporate citizen, resident and inhabitant of the State of Texas and of the United States and of the Northern District of Texas.

(e) The Defendant The Dallas Gas Company is a corporation duly organized and existing under and by virtue of the laws of the State of Texas, with its principal office and domicile in the City of Dallas, Dallas County, Texas, and [fol. 3717] is a corporate citizen, resident and inhabitant of the State of Texas and of the United States and of the Northern District of Texas.

(f) The Defendant Waxahachie Gas Company is a corporation organized and existing under and by virtue of the laws of the State of Arizona but has a principal office in the City of Waxahachie, Ellis County, Texas. During all of the times herein alleged the said Defendant has continuously been qualified, and is now duly qualified, to do and conduct its corporate business in the State of Texas under a permit duly issued to it by the Secretary of the State of the State of Texas. Said Defendant has and maintains an office in the City of Waxahachie, Ellis County, Texas, and in the Northern District of Texas.

(g) The Defendant Gainesville Gas and Electric Company is a corporation duly organized and existing under and by virtue of the laws of the State of Texas, with its principal office and domicile in the City of Gainesville, Cooke

2185

County, Texas, and is a corporate citizen, resident and inhabitant of the State of Texas and of the United States and of the Eastern District of Texas.

IV

This suit is of a civil nature in equity and is brought for the purpose of restraining and enjoining the enforcement and execution of a certain Order entered by The Railroad Commission of Texas, signed by the persons constituting the said Commission, in Gas Utilities Docket No. 75, dated [fol. 3718] September 13, 1933, finding, among other things, that the price of forty cents (40¢) per one thousand (1,000) cubic feet charged by the Plaintiff for domestic gas transported, sold and delivered by it in interstate and intrastate commerce to the corporate Defendants at the city gates of approximately two hundred fifty (250) towns and cities located within the State of Texas, is unreasonable and excessive to the extent of eight cents (8¢) per one thousand (1,000) cubic feet; that thirty-two cents (32¢) per one thousand (1,000) cubic feet is a reasonable price to be charged and collected for said gas; and ordering and commanding Plaintiff, hereafter, to charge and receive for such gas from the corporate Defendants herein a rate not to exceed thirty-two cents (32¢) per one thousand (1,000) cubic feet. A true and correct copy of said Order, together with the accompanying Opinion of The Railroad Commission, is hereto attached, marked "Exhibit A" for identification, and by such reference incorporated herein and made a part hereof.

This suit is also brought for the purpose of restraining and enjoining the Defendants Community Natural Gas Company, Municipal Gas Company, Texas Cities Gas Company, County Gas Company, the Dallas Gas Company, Waxahachie Gas Company and Gainesville Gas and Electric Company and each of them, who are the distributing companies having contracts with Plaintiff which will be affected by the aforesaid Order, from failing or refusing to carry out their respective contracts with the Plaintiff for the sale by [fol. 3719] Plaintiff and purchase by the said several corporate Defendants of natural gas for domestic purposes at the city gates of approximately two hundred fifty (250) towns and cities wherein the said corporate Defendants own and operate natural gas distribution plants; and which said contracts provide a rate, price or charge of forty cents (40¢)

er one thousand (1,000) cubic feet and which said price or harge the said corporate Defendants have for many years een paying, and are now paying to the Plaintiff for domes- c natural gas, as more particularly stated hereinafter.

This suit presents a substantial Federal question and ontroversy arising under the Constitution and laws of the nited States in that, as Plaintiff avers, the rate or price hat the said Order of The Railroad Commission of Texas equires the Plaintiff to charge the corporate Defendants or natural gas is confiscatory of Plaintiff's property used r useful in the public service and in furnishing natural gas the said corporate Defendants; and the promulgation and nforcement of the said Order necessarily does and will de- rive Plaintiff of its property, devoted to public service and sed and useful therein, without due process of law, denies Plaintiff the equal protection of law, denies to Plain- ff freedom of contract and impairs the obligation of con- act, and directly and substantially interferes with the busi- ess of Plaintiff and its right to engage in interstate com- erce free from such direct and substantial interference, l in violation of its rights under the Constitution of the nited States, and specifically in violation and contraven-
ol. 3720] tion of the Fourteenth Amendment, Section 10 Article 1 and Section 8 of Article 1 of the Constitution of e United States, as is hereinafter more fully set forth. herefore said Order of The Railroad Commission of Texas null and void.

The amount in controversy in this suit exceeds the sum or lue of Three Thousand & 00/100 ($3,000.00) Dollars, ex- usive of interest and costs.

V

For more than fifteen (15) years prior to the filing of this it the Plaintiff has owned and operated a system of pipe es and appurtenant equipment located in the States of klahoma and Texas, and during all of that time has been gaged in the production, purchase, transportation and le of natural gas in interstate commerce in said States as a ntinuous and established business. From time to time and er since its incorporation on June 4, 1909, and down to e time of the filing of this suit, additional supplies of gas ing necessary for the conduct of the Plaintiff's business, laintiff has caused to be purchased in the States of Texas

and Oklahoma gas leases and gas rights and has caused to be constructed at great expense numerous pipe lines connecting its source of gas supply in the States of Texas and Oklahoma with the markets which it serves in interstate commerce in the States of Texas and Oklahoma.

Plaintiff is engaged in the purchase, production, transportation and sale of natural gas from approximately four thousand (4,000) miles of integrated pipe line system in [fol. 3721] Texas and Oklahoma to natural gas distributing companies doing business in the two said States, including the corporate Defendants herein, and which said natural gas distributing companies serve more than two hundred thousand (200,000) customers in the State of Texas, representing a population of more than one million people. Plaintiff supplies natural gas at wholesale and for domestic purposes to the said distributing companies at the city gates of more than two hundred seventy-five (275) towns, cities and communities in the States of Oklahoma and Texas, at a uniform price of forty cents (40¢) per one thousand (1,000) cubic feet, with negligible exceptions necessitated by long term contracts. The said city gate price of forty cents (40¢) per one thousand (1,000) cubic feet has been established by written contracts between Plaintiff and the various natural gas distributing companies, including the corporate Defendants herein, and said contracts, all of which are now and were at the time of the entry of the Order by the Railroad Commission in full force and effect, and said uniform price have prevailed for a period of many years preceding the filing of this suit. By virtue of its said contracts with the several distributing companies who are corporate Defendants herein, the Plaintiff has been engaged continuously, and is now engaged in transporting, selling at wholesale and delivering through its pipe lines in interstate commerce natural gas for domestic purposes in substantial amounts at the city gates of the following towns and cities in the State of Texas, to-wit: Dallas, Gainesville, Sherman, Wichita Falls, Denison, Denton, McKinney, Vernon, Bon- [fol. 3722] ham, and many others. The gas so delivered by Plaintiff at the city gates of said towns and cities has been and is now being transported uninterruptedly through Plaintiff's high pressure pipe lines extending from the State of Oklahoma into the State of Texas.

VI

That on or about the 14th day of October, 1932, The Railroad Commission of Texas ordered an investigation of the reasonableness of the rates and charges of the Lone Star Gas Company for natural gas sold and delivered at the city gates of the several towns and cities in the State of Texas where Plaintiff was selling gas at wholesale, and set said cause or investigation for a hearing on November 1, 1932. Said cause was and is known as Gas Utilities Docket No. 75, before The Railroad Commission of Texas.

The hearings in said investigation before the said Commission were held from time to time, and evidence and exhibits were introduced to show that the contracts between the Plaintiff and the corporate Defendants herein, and under which contracts the Plaintiff sells natural gas to the corporate Defendants at the city gate, were reasonable and were contracts such as would be made by persons dealing at arm's length; that the rate or price of forty cents (40¢) per one thousand (1,000) cubic feet, which the Plaintiff charges to the corporate Defendants herein for natural gas delivered for domestic purposes at the city gates of the towns and cities served in the State of Texas by the Plaintiff's pipe line system, was fair and reasonable; that the fair [fol. 3723] value of the property of the Plaintiff used or useful in the business of supplying natural gas to the corporate Defendants herein and all other natural gas distributing companies receiving gas at the city gate from the Plaintiff was more than Seventy Million ($70,000,000.00) Dollars; that a fair minimum allowance for depreciation, depletion and amortization reserve charge was more than Three Million, Four Hundred Thousand & 00/100 ($3,400,000.00) Dollars per annum; that the fair and reasonable annual net return which the Plaintiff should be permitted to earn under rates imposed upon it by public authority was not less than ten per cent (10%) of the present fair value of its said properties used and useful in the public service after deducting operating expenses of every kind and character, including a proper allowance for depreciation, depletion and other reserves.

VII

That on or about the 13th day of September, 1933, The Railroad Commission of Texas handed down an Order, ac-

companied by an Opinion, in Gas Utilities Docket No. 75 before The Railroad Commission of Texas, heretofore identified as "Exhibit A" and made a part of this Bill of Complaint; that in this Order, together with the accompanying Opinion, The Railroad Commission of Texas purported to find that the price of forty cents (40¢) per one thousand (1,000) cubic feet for domestic gas sold by the Plaintiff to the corporate Defendants herein was excessive and unreasonable; that said charge was excessive in the amount of [fol. 3724] eight cents (8¢) per one thousand (1,000) cubic feet; that thirty-two cents (32¢) is a reasonable price for Plaintiff to receive for such gas; and said Order, in effect, commanded and decreed that the Plaintiff Lone Star Gas Company should thereafter ignore its contracts with the corporate Defendants herein and make no charge to them and receive no payments from them for domestic gas transported and delivered by it at a rate price or charge in excess of thirty-two cents (32¢) per one thousand (1,000) cubic feet.

Plaintiff shows that The Railroad Commission of Texas is the final legislative and administrative Board or Commission to which Plaintiff may appeal, and no other legislative or administrative board, commission, body or agency of the State of Texas is authorized to supersede the rate, price or charge of the Plaintiff as fixed by The Railroad Commission of Texas, and to establish fair, reasonable and compensatory rates in lieu thereof. Therefore, the legislative remedy of this Plaintiff to prevent the confiscation of its property under the said Order, "Exhibit A" hereto, has been exhausted.

Plaintiff therefore shows that it has no plain, adequate and complete remedy at law.

VIII

Plaintiff shows that the Opinion and Order of The Railroad Commission of Texas, said Opinion and Order being "Exhibit A" hereto, found a reproduction cost, new, as of December 31, 1931, for Transmission and Production prop- [fol. 3725] erties, exclusive of Leaseholds, of Forty-four Million, Six Hundred Six Thousand, Three Hundred Thirty-seven & 16/100 ($44,606,337.16) Dollars; a fair value of Leaseholds as of December 31, 1931, of One Million, Nine Hundred Ninety-one Thousand, Six Hundred Thirteen

& 92/100 ($1,991,613.92) Dollars, and a "rate base" of Forty-six Million, Two Hundred Forty-six Thousand, Six Hundred Seventeen & 53/100 ($46,246,617.53) Dollars to cover Plaintiff's public service property used and useful in connection with its business of purchasing, transporting, selling and delivering natural gas in interstate and intrastate commerce. Said rate base so found by The Railroad Commission of Texas was at least Twenty-three Million & 00/100 ($23,000,000.00) Dollars lower than the fair and reasonable value of said property as of December 31, 1931, January 1, 1933, and now, and the method adopted, and the results reached by The Railroad Commission of Texas was erroneous and contrary to the well established rules of law in that, among other things:

(a) The said Commission completely disregarded and ignored, not only the actual cost of Plaintiff's public service property as reflected by its books, in the approximate amount of Fifty Million ($50,000,000.00) Dollars, which, in view of recent increases in the cost of steel pipe, and the upward trend of prices generally and particularly applicable to materials going into and comprising Plaintiff's public service property, fairly represented a minimum value of the property and elements of value included therein;

[fol. 3726] (b) The said Commission grossly underestimated the true present reproduction cost of the public service property of the Plaintiff and the items of property which the Commission included in its reproduction cost estimate, in that, among other things, it entirely disregarded and ignored substantial increases in the cost of steel pipe comprising by far the greater part of the value of the physical property included in the Commission's estimate;

(c) The said Commission, as is disclosed by its Order and Opinion, "Exhibit A," arbitrarily and capriciously eliminated from its so-called determination of a rate base numerous items of physical property which were and are both used and useful by the Plaintiff in its public service business, some of the items so eliminated by the Commission being gas wells and gas leaseholds, and other property owned by the Plaintiff and located in what is known as the Petrolia Field, and actually used and useful in the best judgment of the management of the Plaintiff in connection with Plaintiff's public service business, the actual cost of said properties in

the aggregate amounting to Six Hundred Eighty-seven Thousand, Seven Hundred Eighty-one & 13/100 ($687,-781.13) Dollars; and furthermore the said Commission arbitrarily and capriciously eliminated from its so-called rate base, and contrary to the undisputed testimony in said investigation, net capital additions to the public service property of Plaintiff in the calendar year of 1932, which net capital additions had an actual cost to Plaintiff of Two Million, Two Hundred Fifty-seven Thousand, Six Hundred Eighty-two & 07/100 Dollars ($2,257,682.07);

[fol. 3727] (d) The said Commission wholly failed and refused to include in its so-called "rate base," as reflected by the Order and Opinion, "Exhibit A" hereto, any amount to cover that element of value actually present in and constituting a part of Plaintiff's public service property, known and referred to as "going value" or "going concern value" or value resulting from the business which the Plaintiff has developed and which it now has;

(e) The said Commission, as disclosed by the Order and Opinion, "Exhibit A" hereto, in stating the net income of the Plaintiff which would be available for return under the present city gate rate of forty cents (40¢) per one thousand (1,000) cubic feet, and under the thirty-two cent city gate rate made mandatory by the aforesaid Order, improperly computed the net income of the Plaintiff from its public service property for the calendar year of 1931, improperly and arbitrarily disallowed necessary operating expenses actually incurred in the amount of Two Hundred Seventeen Thousand, Eight Hundred Eighty-four & 05/100 ($217,-884.05) Dollars for the calendar year of 1931, and also wholly and improperly disregarded as an operating expense the Federal income taxes which were payable for said year. In this connection, Plaintiff would show that all of the operating expenses incurred by the Plaintiff and reflected by its books for the calendar year of 1931, and all other periods herein, were incurred in the exercise of good faith and reflected the best judgment of the management of the Plaintiff.

(f) The Railroad Commision of Texas, in the Order and [fol. 3728] Opinion, "Exhibit A" hereto, in computing the amount available to Plaintiff for return on its public service property, allowed only the grossly inadequate sum of Nine

Hundred Sixty-eight Thousand, Sixty-six & 98/100 ($968,066.98) Dollars, or less than two per cent (2%) of the actual cash cost of the Plaintiff's public service property, as an annual depreciation charge; whereas, there was no competent testimony of any kind or character introduced in said investigation before The Railroad Commission of Texas upon which such a determination could have been made.

(g) Said Order, "Exhibit A" hereto, does not and will not in the future permit a fair return to the Plaintiff upon its property used and useful in the public service and in the suppyling of natural gas service to the corporate Defendants herein and to other natural gas distributing plants receiving their natural gas supply wholesale at the city gate from this Plaintiff. Said Order, together with the accompanying Opinion upon which said Order purports to be based, does, in fact, and its effect will be (1) to restrict the "rate base" to approximately sixty-six per cent (66%) of the true value of the Plaintiff's said property; (2) to exaggerate the net earnings of the Plaintiff and to make said net earnings appear to be in excess of Plaintiff's true net earnings; and (3) to restrict the return yielded by such fictitious net earnings upon said insufficient and improper rate base to the wholly inadequate and confiscatory rate of six per cent (6%) per annum, as stated in "Exhibit A" hereto. In this connection, [fol. 3729] Plaintiff shows that the minimum return which has been generally allowed in this territory to other public utilities of a less hazardous nature is eight per cent (8%) per annum.

(h) The aforesaid Order of The Railroad Commission of Texas, in determining the gross and net revenues of the Plaintiff for the purpose of calculating the rates for domestic gas to be charged at the city gate by the Plaintiff, has erroneously and improperly disregarded the decline in gross and net revenues of the Plaintiff for the calendar years of 1931 and 1932, and for the twelve months ended April 30, 1933, in spite of the fact that the volume of business of the Plaintiff and the trend of its annual earnings have been continuously downward since the year 1929, and all of which was made manifest in the investigation by the said Commission.

Specifically, the Plaintiff would show that if the said Order, "Exhibit A" hereto, had been effective continuously

during the year of 1932 on all of its sales of domestic gas at the city gates of the towns and cities supplied by its integrated pipe line system in the States of Oklahoma and Texas, then (1) using the actual public service revenues and operating expenses of the Plaintiff for the calendar year of 1932, and (2) using the rate base of Forty-six Million, Two Hundred Forty-six Thousand, Six Hundred Seventeen & 53/100 ($46,246,617.53) Dollars, and (3) using the depreciation allowance of Nine Hundred Sixty-eight Thousand, Sixty-six & 98/100 ($968,066.98) Dollars, as allowed by the Opinion and Order, "Exhibit A" hereto, the net amount [fol. 3730] available for return to Plaintiff would have been only Two Million, Four Hundred Eighty-four Thousand, Five Hundred Twelve & 41/100 (2,484,512.41) Dollars, or only five and thirty-seven one-hundred-s (5.37%) per cent upon said rate base or property value and, similarly, the net amount available for return for the twe've months ended June 30, 1933, would have been Two Million, Three Hundred Sixty-two Thousand, Eight Hundred Seventy-two & 09/100 ($2,362,872.09) Dollars, or only five and eleven one-hundredths (5.11%) per cent upon said rate base or property value, whereas by the said Order and Opinion, "Exhibit A" hereto, it was determined that six per cent (6%) per annum was the minimum annual net return which Plaintiff was entitled to receive.

IX

The public service business of the Plaintiff has been conducted efficiently and economically during all of the times herein referred to, and is now being so conducted. In truth and in fact the operating expenses of the Plaintiff for the past three (3) years have been unusually low and will tend to materially increase in the future. Plaintiff shows that it has subscribed to and complied with the employment agreement of the President of the United States, as modified for the natural gas industry, all as pursuant to the National Industrial Recovery Act, and that the effect thereof, due to the shortening of labor hours and increases in wages and salaries, will be to add not less than Two Hundred and Fifty Thousand Dolars ($250,000.00) per annum to the inescapa- [fol. 3731] ble operating expenses in connection with the public service business of the Plaintiff.

X

Plaintiff shows that the present fair value of its property used and useful in the business of supplying natural gas to the corporate Defendants herein, and all other natural gas distributing companies receiving gas at the city gate from the Plaintiff, was at the time of the hearing before The Railroad Commission, and is now, more than Seventy Million Dollars ($70,000,000.00); that a sum not less than Three Million, Four Hundred Thousand ($3,400,000.00) Dollars is a fair minimum annual allowance for a depreciation, depletion and amortization reserve charge; that a fair and reasonable annual net return which it should be permitted to earn, considering the hazards of the natural gas business, the rate of return of other utilities of a less hazardous nature, the return necessary to attract a free flow of capital for investment in the enterprise and to insure the financial soundness of the Plaintiff, is not less than ten per cent (10%) of the present fair value of its public service properties after deducting operating expenses and an annual allowance for depreciation, depletion and other proper reserves.

Plaintiff further shows that the net amount available for depreciation, depletion, amortization, Federal income tax and return on said value of its public service properties for the year ended December 31, 1931, at the prevailing rate of forty cents (40¢) per one thousand (1,000) cubic feet for domestic gas was only Four Million, Nine Hundred Eight [fol. 3732] Thousand, Twenty-four & 24/100 ($4,908,024.24) Dollars, or approximately seven per cent (7%) on said rate base; and that deducting Federal income taxes and the sum of Three Million, Four Hundred Thousand & 00/100 ($3,400,000.00) Dollars as the fair and reasonable allowance for depreciation, depletion and amortization for the year ending December 31, 1931, leaves for net return less than two per cent (2%) on said rate base or fair value.

XI

Plaintiff would show that it has devoted and dedicated to, and used and useful in the business of supplying natural gas and natural gas service to the towns and cities in the States of Oklahoma and Texas, which towns and cities it supplies with natural gas at the city gates, properties of the actual cash cost, as reflected by its books on December 31, 1932, of Fifty Million, Thirty-four Thousand, Four Hundred

Thirty-one & 70/100 ($50,034,431.70) Dollars, and that the cost of its public service property as reflected by its books is less than the true value thereof for the reason that in the twenty-four (24) years of its corporate existence it has not been its general policy to capitalize engineering and supervisory costs, administrative and legal expenses and taxes and interest during construction. The said cost of Fifty Million, Thirty-four Thousand, Four Hundred Thirty-one & 70/100 ($50,034,431.70) Dollars, which the books of the Plaintiff reflect as the cost of its public service properties on December 31, 1932, does not include materials and supplies on hand and used and useful in the public service business of the Plaintiff, nor does it include cash working capi- [fol. 3733] tal requirements of the Plaintiff necessary in the conduct of its public service business. In this connection, Plaintiff would show that for the year ended December 31, 1932, the net amount available for depreciation, depletion, amortization and return on its public service properties was Four Million, Six Hundred Fifty-eight Thousand, Five Hundred Six & 46/100 ($4,658,506.46) Dollars, or only nine and thirty-one-one-hundredths (9.31%) per cent of the actual cost of the properties reflected by the books of the Plaintiff on December 31, 1932.

Also, Plaintiff would show that the actual cost to the Plaintiff of its public service properties as reflected by its books on June 30, 1933, was Forty-nine Million, Nine Hundred Twenty-three Thousand, One Hundred Thirty-seven & 26/100 ($49,923,137.26) Dollars, and that for the twelve (12) months ended June 30, 1933, the net amount available for depreciation, depletion, amortization and return on said public service property was Four Million, Four Hundred Ninety-one Thousand, Eight Hundred Twenty-five & 60/100 ($4,491,825.60) Dollars, or only eight and ninety-nine-one-hundredths (8.99%) per cent of the said book cost.

XII

That the enforcement of said Order, "Exhibit A" hereto, will, as heretofore shown, operate to confiscate the public service property and business of the Plaintiff and that under the terms and provisions of said Order, Plaintiff is being and will be subjected to a cash loss of approximately Four [fol. 3734] Thousand & 00/100 ($4,000.00) Dollars per day, and that such loss will continue until the equitable relief herein prayed for is granted.

The Statutes of Texas provide that any person or concern failing to comply with any valid order of the Commission, when not stayed or suspended by court order, shall be subject to penalties payable to the State of Texas of not less than One Hundred Dollars ($100.00) nor more than One Thousand ($1,000.00) Dollars for each offense, each violation and each day such failure to comply continues to constitute a separate offense. Such Statutes likewise provide a fine of not less than Fifty ($50.00) Dollars nor more than One Thousand ($1,000.00) Dollars, and, in addition, imprisonment for not less than ten (10) days nor more than six (6) months, to be imposed on the owner, officer, director, agent or employee of any corporation owning and operating gas pipe lines willfully violating the Statutes governing gas companies doing business in Texas.

In this connection, Plaintiff alleges that unless the Defendants, The Raiload Commission of Texas and the individual members constituting the said Commission, and the Attorney General of the State of Texas, are restrained and enjoined as herein prayed, they will, as Plaintiff believes and so alleges, attempt to compel Plaintiff to supply domestic gas to the Defendant distributing companies at the confiscatory rate prescribed by the Order of the said Railroad Commission of Texas, and, in the event of Plaintiff's failure so to do, will attempt to enforce the penalties prescribed by the Statutes of the State of Texas, and Plain-[fol. 3735] tiff, its directors, officers, agents, servants and employees will be deterred and prevented by the threat of said penalties from charging the presently prevailing rate of forty cents (40¢) per one thousand (1,000) cubic feet for domestic gas and from charging any rate other than that prescribed by the Order of The Railroad Commission, and, thereby, Plaintiff will be forced to submit to the confiscation of its property without due process of law, and in violation of its rights under the Constitution of the United States, as hereinbefore alleged, and will be subjected to great and irreparable loss, damage and injury.

XIII

That the said Order is unconstitutional, null and void, and is in excess of the authority conferred by law upon The Railroad Commission of the State of Texas, in that:

(a) The said Railroad Commission and the Defendant members thereof, in the investigation of the contracts be-

tween Plaintiff and the Defendant distributing companies for the supply of gas at the city gates of the respective communities served by the Defendant distributing companies and the reasonableness of the price or rate charged by Plaintiff under the aforesaid contracts, approached all questions involving the same as if it had power and jurisdiction under the law to fix the rates and commodity charges of the Plaintiff, and has, in effect, undertaken to fix the rates and commodity charges of the Plaintiff in relation to its interstate business, and the effect of the said [fol. 3736] Opinion and Order and the enforcement thereof by the said Railroad Commission is and will be to usurp the power to regulate and burden interstate commerce, and thereby the said Commission has acted wholly without constitutional or lawful authority, power or jurisdiction;

(b) The Railroad Commission of Texas is a creature of the Legislature of the State of Texas, deriving its powers from the Statutes of the State of Texas, which, likewise, limit the exercise of the same; that such right, power and authority as is given to The Railroad Commission of Texas by Statute to investigate the reasonableness of the rate charged by Plaintiff for the sale and delivery of domestic gas, at wholesale at the city gates, to the distributing companies named as Defendants herein is conferred by the provisions of Article 6053, Revised Statutes of Texas, 1925; that if the aforesaid Article purports and was intended to confer upon The Railroad Commission of Texas the power and authority to fix, establish and enforce the adequate and reasonable price of natural gas, and reasonable rates and charges for transporting, producing, distributing, buying, selling and delivering gas moving uninterruptedly in high pressure pipe lines running from outside the State of Texas into the State of Texas, and constituting and being a part of interstate transportation and interstate commerce, then the said Statute under which The Railroad Commission of Texas purported to act in entering the Order, "Exhibit A" hereto, herein attacked, is void as being in contravention of the commerce clause of the Constitution of the United [fol. 3737] States. That if the said Statute should be construed as not conferring, or having been intended to confer upon The Railroad Commission of Texas the power of fixing and establishing rates and prices for natural gas moving continuously from outside the State of Texas into the

State of Texas in high pressure pipe lines, such movement, transportation and sale being a part of interstate commerce, then The Railroad Commission of Texas, in entering the Order which it has entered in this case has exceeded the power and authority conferred upon it by law, and has usurped a power not conferred upon it by law, for which reason the Order herein attacked is unconstitutional, null and void.

(c) A substantial portion of the natural gas purchased by the Defendant distributing companies respectively at the respective city gates of the various communities served by them is natural gas transported by Plaintiff in interstate commerce, national in its character, and Plaintiff is lawfully entitled to sell said gas to the several Defendant distributing companies herein and to other purchasers in the State of Texas and Oklahoma without interference by The Railroad Commission of Texas; and the Opinion and Order of The Railroad Commission of Texas, "Exhibit A" attached hereto, unlawfully deprives the Plaintiff of the benefits and advantages of its ownership of said gas and said pipe line system and the fruits of its said interstate transportation, and unlawfully denies to Plaintiff the free right to sell from its said transportation system its natural [fol. 3738] gas so continuously transported in interstate commerce and unlawfully deprives Plaintiff of the rights guaranteed to it by Article 1, Section 8, Clause 3 of the Constitution of the United States, and imposes upon Plaintiff an unreasonable regulation, and places an undue and direct burden upon, and constitutes a direct interference with interstate commerce.

(d) The said Opinion and Order, "Exhibit A" hereto, violates Article 1, Section 10, Subdivision 1 of the Constitution of the United States in that they, and each of them, impair the obligation of the contracts between Plaintiff and the several Defendant distributing companies, under which each of the said Defendant distributing companies purchases gas from the Plaintiff.

(e) The said Opinion and Order, "Exhibit A" hereto, are in violation of the Fourteenth Amendment to the Constitution of the United States, in that they deprive the Plaintiff of its property without due process of law, de-

stroys its freedom of contract, and deny to it the equal protection of the laws.

(f) The said Order of The Railroad Commission of Texas requiring Plaintiff to charge and collect for domestic gas delivered by it to the various distributing companies thirty-two cents (32¢) per one thousand (1,000) cubic feet, and denying to it the right to charge an amount in excess thereof, fixes a rate, charge and price that would not produce a reasonable return on the present fair value of the public service properties of the Plaintiff, used and useful [fol. 3739] in furnishing its interstate as well as intrastate gas service to Defendant distributing companies and others, and if the Plaintiff were required to deliver gas to the said distributing companies at the rate of thirty-two cents (32¢) per one thousand (1,000) cubic feet, as prescribed by The Railroad Commission, the result would be that the Plaintiff's public service properties would be confiscated, and it would be deprived of its properties without due process of law, all in violation of the Fourteenth Amendment to the Constitution of the United States.

(g) The Plaintiff, in the sale of the natural gas transported by it in interstate commerce, is limited to the markets connected with its transportation system as now located, and if the said Orders of the Railroad Commission are enforced, the result will be that Plaintiff will be deprived of all markets for its domestic gas at rates and charges other than those attempted to be established by the said Railroad Commission in its Opinion and Order, and Plaintiff will be deprived of the right to carry on its business, and will be deprived of its property without due process of law, all in violation of the Fourteenth Amendment and the Commerce Clause of the Constitution of the United States.

(h) In refusing to include in the rate base of the Plaintiff and in a determination of the present value of its public service property, as more fully appears in "Exhibit A" hereto, certain items of property used and useful by the Plaintiff in its public service business, and in excluding from operating expenses, expenses actually and normally [fol. 3740] incurred by the Plaintiff in the conduct of its said business, and in the exercise of the best judgment of

its officers and directors. The Railroad Commission of Texas unlawfully and unreasonably usurped the prerogatives, duties and authority of the officers and directors of the Plaintiff upon whom rests the responsibility for the management of the Plaintiff's business; all in violation of the rights of the Plaintiff under the Constitution of the United States, and with the result that, to the extent of such arbitrary deductions, Plaintiff is deprived of its property devoted to public use without due process of law, and its property is confiscated, contrary to the provisions of the Fourteenth Amendment to the Constitution of the United States.

(i) The said Order of The Railroad Commission of Texas is void and in excess of the authority conferred by law upon the said Commission in that it deprives Plaintiff of an opportunity to have a judicial determination as to the legality of its contracts and charges to each of the Defendant distributing companies, by arbitrarily requiring the Plaintiff to reduce its charges for its gas to each of the Defendant distributing companies, irrespective of whether such charges be finally sustained as legal or not; and the said Order further on this account seeks to deprive, and does deprive, the Plaintiff of its property and business without due process of law and denies Plaintiff the equal protection of the laws under the Fourteenth Amendment to the Constitution of the United States, and operates to impair the obligations of its contracts with each of the Defend- [fol. 3741] ant distributing companies, contrary to Section 10 of Article 1 of the Constitution of the United States.

XIV

Each and every one of the said contracts between the Plaintiff and the corporate Defendants providing for the sale by the Plaintiff and purchase by the Defendants of natural gas for domestic purposes at the city gates of the several towns and cities in the State of Texas are affected by the Order, "Exhibit A" attached hereto, of The Railroad Commission of the State of Texas. The result of the promulgation and enforcement of the aforesaid Order is and will be to change and vary the obligations of each of the Defendant distributing companies under their respective

contracts with the Plaintiff in that the said distributing companies will be permitted, and, in effect, compelled to pay thirty-two cents (32¢) per one thousand (1,000) cubic feet for gas delivered to them under their aforesaid contracts, instead of forty cents (40¢) per one thousand (1,000) cubic feet as now required by said contracts. The right and power of The Railroad Commission of the State of Texas to enter the Order in question, thus changing the contracts to which the distributing companies are parties, and their obligations thereunder, are directly and substantially involved herein. Each and every distributing company which is named as a Defendant herein is interested in and will be affected by the enforcement of the Order herein complained of, and is a proper and necessary party to a full and complete determination of the Federal questions [fol. 3742] involving said contracts raised by the Plaintiff in this Bill of Complaint.

Plaintiff shows that said contracts and the business had by the plaintiff pursuant thereto are absolutely necessary for the continuance of Plaintiff as a going concern, and that Plaintiff could not survive without such business, nor can it supply natural gas under said contracts at the rate prescribed by The Railroad Commission without a resultant destruction in the value of its property required in performing its obligations.

Plaintiff represents that with respect to its public service business, its sales of gas for industrial purposes and all purposes other than for domestic use, are profitable to it in that such sales produce substantial net revenues over and above the cost of making such sales. Industrial gas is sold in open market competition with other fuels and it is not possible for Plaintiff to increase its net earnings by increasing its rates and charges for industrial gas or for gas sold for other than domestic purposes.

Furthermore, Plaintiff shows that the distributing companies named as Defendants are necessary and proper parties to the granting of that relief requisite to fully and completely protect it preliminarily and upon final hearing; and that the relief hereinafter prayed against them is ancillary and incidental to the relief sought by the Plaintiff against the enforcement of the Order herein complained of. In this connection, Plaintiff says that while the Order in question does not purport or expressly undertake to pro-

hibit the distributing companies from paying the Plaintiff an amount in excess of thirty-two cents (32¢) per one thou-
[fol. 3743] sand (1,000) cubic feet for domestic gas purchased at the city gates, nevertheless such is and must be the necessary and inevitable effect of the enforcement of such Order.

That unless the said distributing companies are restrained as hereinafter prayed, during the pendency of this suit, Plaintiff believes and so alleges that voluntarily or involuntarily, through fear of violating or aiding and abetting in the violation of the said Order of The Railroad Commission of the State of Texas, "Exhibit A" hereto, and because of the threat of penalties prescribed by law, the Defendant distributing companies will not pay Plaintiff in excess of the rate of thirty-two cents (32¢) per one thousand (1,000) cubic feet prescribed by the said Order, "Exhibit A" hereto, and will be coerced and deterred from paying Plaintiff the rates and charges for domestic gas as fixed and prescribed under the terms of their respective contracts with the Plaintiff governing the sale and purchase of domestic gas, and thereby Plaintiff will be forced to submit to the confiscation of its property without due process of law and in violation of its rights under the commerce and contract clauses of the Constitution of the United States as alleged hereinbefore more specifically, all to its great and irreparable damage, loss and injury.

XV

Furthermore, if, during the pendency of this suit, as Plaintiff believes and alleges, the distributing companies will be induced and caused to resist and refuse payment of any charges and rates for natural gas furnished and sup-
[fol. 3744] plied by Plaintiff other than those that may result from the enforcement of the said Order of The Railroad Commission of the State of Texas, Plaintiff has no adequate remedy at law and no practical way to collect the charges due it under the contracts aforesaid. Plaintiff can not refuse service because of default of the Defendant distributing companies in the payment of bills for domestic gas, without subjecting itself to penalties for violation of the Order of The Railroad Commission of the State of Texas, and without precipitating a large number of suits in various jurisdictions throughout the State of Texas to

restrain its action in this respect and for damages; nor can it attempt to collect its bills through litigation without being subject to an endless multiplicity of suits, the issues in which would be the same as those herein involved. In each of said suits the issues will be the same and it will be necessary to determine whether the rates charged by the Plaintiff are lawful, just and reasonable.

This suit is, therefore, brought to prevent such a multiplicity of suits and in order that all matters in controversy may be determined in this one proceeding.

Plaintiff has no plain, adequate and complete remedy at law.

Wherefore, being without adequate remedy save in this court of equity, Plaintiff prays the Court:

First, that the rate, charge and price of thirty-two cents (32¢) per one thousand (1,000) cubic feet for domestic gas, as fixed and prescribed in the Opinion and Order of The Railroad Commission of Texas, "Exhibit A" hereto, of [fol. 3745] date September 13, 1933, be decreed to be confiscatory and in violation of the Constitution of the United States, and that said Opinion and Order imposing said rate be declared to be unconstitutional, null, void and unenforceable.

Second, that The Railroad Commission of Texas, its agents, servants, employees and representatives, and the individual members of The Railroad Commission of Texas, and the Attorney General of the State of Texas, Defendants herein, and each of them, as well as their successors in office, and their agents, servants, employees and representatives, and all other persons, be temporarily and permanently restrained and enjoined from any attempt to enforce the said Opinion and Order of The Railroad Commission of Texas of September 13, 1933, "Exhibit A" hereto, or any other order of the said Railroad Commission of Texas in this or any other proceeding based thereon or giving effect thereto, or to compel Plaintiff, its directors, officers, agents, servants and employees, directly or indirectly, whether by penalties, forfeitures or otherwise, in any manner whatsoever, to observe and comply with the said Order in any respect, or to observe or comply with any other Order of The Railroad Commission of Texas that may be based in whole or in part on or which gives any effect to said Opinion

and Order, or to compel Plaintiff, its directors, officers, agents, servants and employees, directly or indirectly, to observe, comply with and keep in force, and charge, bill and collect from the distributing companies to which it delivers domestic gas, the rate of thirty-two cents (32¢) per [fol. 3746] one thousand (1,000) cubic feet prescribed by The Railroad Commission of Texas in its said Opinion and Order, "Exhibit A" hereto, and to prevent or in any way, directly or indirectly, to interfere with Plaintiff, its directors, officers, agents, servants and employees, in charging, billing and collecting for domestic gas delivered by it at the city gates of various towns and cities located in the State of Texas, now or at any time in the future, forty cents (40¢) per one thousand (1,000) cubic feet; and that the enforcement and execution of the said Opinion and Order of the Railroad Commission of Texas of September 13, 1933, "Exhibit A" hereto, be temporarily and permanently enjoined and restrained;

Third, that The Railroad Commission of Texas, its agents, servants, employees and representatives, and the individual members of The Railroad Commission of Texas, and the Attorney General of the State of Texas, Defendants herein, and each of them, as well as their successors in office and their agents, servants, employees and representatives, and all other persons, be temporarily and permanently enjoined and restrained from attempting in any way, directly or indirectly, whether by threat of penalties, forfeitures, or in any manner whatsoever, to compel the distributing companies named to comply with and observe the said Opinion and Order of The Railroad Commission of Texas, of September 13, 1933, "Exhibit A" hereto, or the rate of thirty-two cents (32¢) per one thousand (1,000) cubic feet for domestic gas furnished by Plaintiff to them, and each of them, or to prevent them from paying, or interfering with their paying, the rate, charge and price for [fol. 3747] domestic gas delivered to them by Plaintiff, fixed by their respective contracts with Plaintiff.

Fourth, that the Defendant distributing companies, and each of them, their directors, officers, agents, servants, employees and representatives, and all other persons, be temporarily and permanently restrained and enjoined from observing or complying with the said Order of The Railroad Commission of Texas, "Exhibit A" hereto, or any other order of the said Railroad Commission; or any law,

ordinance or order that may be based in whole or in part on the said Order of The Railroad Commission, "Exhibit A" hereto, or that may purport to or does give any effect thereto, or from failing or refusing to pay to Plaintiff for domestic natural gas delivered by Plaintiff to them at the various city gates, a price or rate per thousand cubic feet less than the price, rate and charge which each and all of said distributing companies have been and are now paying to Plaintiff for such gas.

Fifth, that for the hearing of this cause and with respect to the granting of the temporary and interlocutory injunction and the permanent injunction herein prayed for, this Honorable Court and the Judge hereof call to his assistance two additional Judges, as provided by Section 266 of the Judicial Code of the United States.

Sixth, that Plaintiff have such other and further relief, both general and special, as may be just and equitable in the premises.

[fol. 3748] May it please your Honors to grant unto the Plaintiff a writ of subpœna of the United States of America, issuing out of and under the seal of this Honorable Court, directed to the said Defendants, The Railroad Commission of Texas, Lon A. Smith, C. V. Terrell and E. O. Thompson, said persons being the members of and constituting The Railroad Commission of Texas, James V. Allred, Attorney General of the State of Texas, Community Natural Gas Company, Municipal Gas Company, Texas Cities Gas Company, County Gas Company, The Dallas Gas Company, Waxahachie Gas Company, and Gainesville Gas and Electric Company, corporations, commanding them, and each of them, on a certain day to be named therein, and under a certain penalty, to appear and make answer to this Bill of Complaint, and to perform and abide by such orders, directions or decrees as may be made them in the premises, and that pending the final hearing of this cause, a preliminary and interlocutory injunction may be issued as above prayed. May it likewise please your Honor to authorize issuance of notice of said hearing to Miriam A. Ferguson, Governor of the State of Texas.

And the Plaintiff will ever pray.

Lone Star Gas Company, by Karl F. Griffith, Thompson & Barwise, Ben H. Powell, Roy C. Coffee, Marshall Newcomb, Its Solicitors.

[fols. 3749-3841] UNITED STATES OF AMERICA,
The State of Texas,
County of Dallas, ss:

On this 21st day of September, 1933, before me personally appeared Karl F. Griffith, who being by me first duly sworn, deposes and says that he is Vice-President of Lone Star Gas Company, the Plaintiff herein; that he has read the foregoing Bill of Complaint and knows the contents thereof; that he is familiar with all the matters and facts involved therein, and that he had knowledge of all the facts upon which the special relief prayed for herein is asked, and that all of the allegations, denials and facts therein contained are true.

Karl F. Griffith.

Subscribed and sworn to before me this 21st day of September, A. D. 1933. Chas. G. Hess, Jr., Notary Public in and for Dallas County, Texas. My commission expires the 1st day of June, 1935. (Notarial Seal.)

[fols. 3842-3930] Defendant's Exhibit No. 3 omitted. See Exhibit "A", printed side pages 19, ante.

[fol. 3931] DEFENDANT'S EXHIBIT No. 4

Lone Star Gas Company

Public Service Operations

Statement of Revenues, Expenses, and Amount Available for Return Based on 32¢ Domestic Gate Rate—Actual Operating Expenses as Reflected by Company's Books—Depreciation and Depletion Allowances as Calculated by Commission

Rate Base as Determined by Commission for Periods Shown Below

Twelve Months Ended December 31st, 1932

Twelve Months Ended June 30th, 1933

[fols. 3972-3975] DEFENDANT'S EXHIBIT No. 13

Lone Star Gas Company
Public Service Operations
Accounting Schedules

Based on Findings by Railroad Commission of Texas and Set Out in Their Opinion and Order Dated September 13, 1933

[fol. 3976] Summarization of Information Shown on Schedules Included in This Report

Section No. 1:

Based on actual revenues (40¢ Domestic Gate Rate), with operating expenses, depreciation and depletion allowance as

found and allowed by the Commission, and Rate Base as found by Commission and set out in their Opinion and Order. The amount available for return, expressed as a percentage of the Rate Base, is as shown below:

Twelve	Months	Ended	December 31st, 1931	8.15%
"	"	"	December 31st, 1932	8.23%
"	"	"	June 30th, 1933	7.55%
"	"	"	December 31st, 1933	6.01%
"	"	"	March 31st, 1934	6.42%

Section No. 2:

Based on actual revenues (40¢ Domestic Gate Rate), with operating expenses, other than gas purchased expense, as found and allowed by Commission, depreciation and depletion allowance calculated in same manner and with same annual rates as found and used by Commission in their Opinion and Order. Rate Base is the amount found by Commission at December 31st, 1931, plus net additions at actual cost to the Company. Based upon the above information, the amount available for return, expressed as a percentage of the Rate Base, is as shown below:

Twelve	Months	Ended	December 31st, 1931	8.15%
"	"	"	December 31st, 1932	7.94%
"	"	"	June 30th, 1933	7.42%
"	"	"	December 31st, 1933	5.98%
"	"	"	March 31st, 1934	6.41%

[fol. 3977] Section No. 3:

Based on adjusted revenues, after giving effect to Commission Order of 32¢ Domestic Gate Rate, with operating expenses, depreciation and depletion allowances as found and allowed by the Commission, and Rate Base as found by Commission and set out in their Opinion and Order dated September 13th, 1933. Based upon these findings the amount available for return, expressed as a percentage of the Rate Base, is as shown below:

Twelve	Months	Ended	December 31st, 1931	5.56%
"	"	"	December 31st, 1932	5.76%
"	"	"	June 30th, 1933	5.22%
"	"	"	December 31st, 1933	3.97%
"	"	"	March 31st, 1934	4.31%

Section No. 4:

Based on adjusted revenues, after giving effect to Commission Order of 32¢ Domestic Gate Rate, with operating expenses, other than gas purchased expense, as found and allowed by the Commission, depreciation and depletion allowance calculated in same manner and with same annual rates as found and used by Commission in their Opinion and Order. Rate Base is the amount found by Commission at December 31st, 1931, plus net additions at actual cost to the Company. Based upon the above information, the amount available for return, expressed as a percentage of the Rate Base, would be as follows:

Twelve	Months	Ended	December 31st, 1931	5.56%
"	"	"	December 31st, 1932	5.57%
"	"	"	June 30th, 1933	5.17%
"	"	"	December 31st, 1933	4.01%
"	"	"	March 31st, 1934	4.36%

[fol. 3978] Section No. 1

Basis of Calculations Included in Schedules Incorporated in This Section of Report

1. Gas Sales:

Based on 40¢ Domestic Gate Rate.

2. Rate Base:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

3. Operating Expenses:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

4. Depreciation and Depletion:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

5. Federal Income Tax:

Based on Amount Available for Return as shown in schedules, less interest charges paid by the Company. The remainder being used as the basis of calculation at the prevailing rate.

Summary of Rate Base Calculations

For Periods Shown Below

	December 31st, 1931	December 31st, 1932	June 30th, 1933	December 31st, 1933	March 31st, 1934
Rate Base to cover Public Service Property and business of Lone Star Gas Co., at December 31st, 1931, as determined by Railroad Commission and referred to on Page 71 of printed Opinion and Order dated 9/13/33	$46,246,617.53	$46,246,617.53	$46,246,617.53	$46,246,617.53	$46,246,617.53
Plus:					
Cost of physical property acquired by Company from Southern Oil Production Co., as of October 1st, 1932, and referred to on Page 79 of printed Opinion and Order of Railroad Commission dated 9/13/33. Proportionate amount applicable by periods	.....	191,650.03	574,950.08	766,600.11	766,600.11
Unamortized Regulatory Commission Expense as referred to on Page 79 of Printed Opinion and Order of Railroad Commission dated 9/13/33. Proportionate amount applicable by periods	.....	81,869.50	151,227.00	167,222.57	179,548.15
Rate Base—By Periods:					
Arrived at in same manner as used by Commission for December 31st, 1932 and set out on Page 79 of their Opinion and Order dated 9/13/33	$46,246,617.53	$46,520,137.06	$46,972,794.61	$47,180,440.21	$47,192,765.79

[fol. 3986]

Rate Base Calculations

December 31st, 1931			
Total Rate Base as shown on Page 71 of printed Opinion and Order of Railroad Commission			$46,246,617.53
December 31st, 1932			
Rate Base December 31st, 1931 as shown on Page 71 of printed Opinion and Order of Railroad Commission			$46,246,617.53
Plus: Cost of physical property acquired by Company from Southern Oil Production Co., as of October 1st, 1932, and referred to on Page 79 of printed Opinion and Order of Railroad Comm..		$766,600.11	
One fourth applicable to this period			191,650.03
Regulatory Expense capitalized for 1932, as set out on Page 79 of printed Opinion and Order of R. R. Commission		$163,739.01	
One half applicable to this period			81,869.50
Rate Base December 31st, 1932 as found by Railroad Commission and set out on Page 79 of printed Opinion and Order			$46,520,137.06
June 30th, 1933			
Rate Base December 31st, 1931 as found by Railroad Commission			$46,246,617.53
Plus: Cost of physical property acquired by Company from Southern Oil Production Company as of October 1st, 1932 and referred to on Page 79 of printed Opinion and Order of R. R. Commission.		$766,600.11	
Three-fourth applicable to this period			574,950.08
Regulatory Expense capitalized:			
Capitalized for 1932		$163,739.01	
Less written off for 1932	$12,422.54		
" " " " 1933 ½ yr	6,211.27	18,633.81	
Applicable for One Year		$145,105.20	
Incurred and capitalized during first 6 mos. 1933	$35,156.51		
One-fourth applicable to this period		8,789.13	
Less written off for 1933—½ year		2,667.33	
Unamortized at June 30th, 1933		$6,121.80	151,227.00

Defendant's Exhibit No. 13—Continued

Rate Base Calculations—(Con.)

June 30th, 1933—(Con.)			
Rate Base June 30th, 1933, arrived at in same manner as used by Commission for December 31st, 1932 and set out on Page 79 of their Opinion and Order			$46,972,794.61
December 31st, 1933			
Rate Base December 31st, 1931 as found by Railroad Commission			$46,246,617.53
Plus: Cost of physical property acquired by Company from Southern Oil Production Company as of October 1st, 1932, and referred to on Page 79 of printed Opinion and Order of Railroad Comm.		$766,600.11	
All applicable to this period			766,600.11
Regulatory Commission Expense:			
Capitalized for the year 1932		$163,739.01	
Charged Off 1932	$12,422.54		
Charged Off 1933	12,422.54	24,845.08	
Unamortized at Dec. 31st, 1933		$138,893.93	
Capitalized for 1933	$66,792.39		
One-half applicable to this period		33,396.19	
Less written off for 1933		5,067.55	
Unamortized at Dec. 31st, 1933		$28,328.64	167,222.57
Rate Base December 31st, 1933, arrived at in same manner as used by Commission for December 31st, 1932, and set out on Page 79 of their Opinion and Order			$47,180,440.21
March 31st, 1934			
Rate Base December 31st, 1931 as found by Railroad Commission			$46,246,617.53
Plus: Cost of physical property acquired by Company from Southern Oil Production Co., as of October 1st, 1932, and referred to on Page 79 of printed Opinion and Order of Railroad Commission		$766,600.11	
All applicable to this period			766,600.11

[fol. 3988] (Brt. Fwd.)			$47,013,217.64
Regulatory Commission Expense:			
Capitalized for 1932		$163,739.01	
Chgd. off for 1932	$12,422.54		
" " " 1933	12,422.54		
" " " 1934—¼ yr.	3,105.63	27,950.71	
Unamortized at March 31st, 1934		$135,788.30	
Capitalized for 1933	$66,792.39		
¾ applicable this period		$50,094.29	
Chgd. off for 1933	5,067.55		
" " " 1934—¼ yr.	1,266.89	6,334.44	
Unamortized at March 31st, 1934		$43,759.85	$179,548.15
Rate Base March 31st, 1934—arrived at in same manner as used by Commission for Dec. 31st, 1932 and set out on Page 79 of their Opinion and Order			$47,192,765.79

Defendant's Exhibit No. 13—Continued

[fol. 3989] Depreciation and Depletion Allowances

Twelve Months Ended December 31st, 1931		
Depreciation:		
Amount allowed by Commission and set out on Page 69 of their Opinion and Order dated September 13th, 1933		$968,066.98
Depletion:		
Amount allowed by Commission and set out on Page 76 of their Opinion and Order dated September 13th, 1933		15,631.45
Total		$983,698.43
Twelve Months Ended December 31st, 1932		
Depreciation:		
Rate Base as found by Commission	$46,520,137.06	
Depreciation rate as shown on Page 80 of Commission's Opinion & Order	2.09%	
Commission Allowance		$972,270.86
Depletion:		
Amount allowed by Commission and set out on Page 76 of their Opinion and Order dated Sept. 13th, 1933		15,327.49
Total		$987,598.35
Twelve Months Ended June 30th, 1933		
Depreciation:		
Rate Base—calculated in same manner as used by Commission—See Rate Base Calculation included in this report	$46,972,794.61	
Depreciation rate as shown on Page 80 of Commission Opinion & Order	2.09%	
Allowance based on finding by Commission		$981,731.41
Depletion:		
Total gas produced—M. Cu. Ft.	5,724,506	
Less 1/8 Royalty	715,563	
Net Gas produced	5,008,943	
Depletion Rate per MCF, as shown on Page 76 of Commission Opinion & Order	$.003174	
Allowance based on finding by Commission		15,898.39
Total		$997,629.80

[fol. 3990]

Amount Available for Federal Income Tax and Return	$3,340,874.34	
Less—Interest Charges	1,072,294.43	
Balance—Subject to Fed. Income Tax	$2,268,579.91	
Federal Income Tax Rate	13.75%	
Federal Income Tax		$311,929.74

[fol. 3992] Section No. 2

Basis of Calculations Included in Schedules Incorporated in This Section of Report

1. Gas Sales:

Based on 40¢ Domestic Gate Rate.

2. Rate Base:

As found by Railroad Commission at December 31st, 1931 and set out in their Opinion and Order dated September 13th, 1933, plus net additions at cost.

3. Operating Expenses:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933, with the exception that additional gas purchase expense allowed by Commission has been eliminated from schedules. The reason for this elimination of expense is due to the inclusion of property formerly owned and operated by Meridian Gas Company being included in Rate Base as a net addition to property.

4. Depreciation and Depletion:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

5. Federal Income Tax:

Based on amount available for return as shown in schedules, less interest charges paid by the Company. The remainder being used as the basis of calculation at the prevailing rate.

Defendant's Exhibit No. 13—Continued

Federal Income Tax		$322,650.94

[fol. 4005] Section No. 3

Basis of Calculations Included in Schedules Incorporated in This Section of Report

1. Gas Sales:

Based on 32¢ Domestic Gate Rate.

2. Rate Base:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

3. Operating Expenses:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

4. Depreciation and Depletion:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

5. Federal Income Tax:

Based on amount available for return, as shown in schedules, less interest charges paid by the Company; the remainder being used as the basis of calculation at the prevailing rate.

Federal Income Tax Rate	13.75%	
Federal Income Tax		$153,646.28

[fol. 4015] Section No. 4

Basis of Calculations Included in Schedules Incorporated in This Section of Report

1. Gas Sales:

Based on 32¢ Domestic Gate Rate.

2. Rate Base:

As found by Railroad Commission at December 31st, 1931, and set out in their Opinion and Order dated September 13th, 1933, plus net additions at cost.

3. Operating Expenses:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933, with the exception that additional gas purchase expense allowed by Commission has been eliminated from schedules. The reason for this elimination of expense is due to the inclusion of property formerly owned and operated by Meridian Gas Company being included in Rate Base as a net addition to property.

4. Depreciation and Depletion:

Based on findings by Railroad Commission and as set out in their Opinion and Order dated September 13th, 1933.

5. Federal Income Tax:

Based on amount available for return as shown in schedules, less interest charges paid by the Company; the remainder being used as the basis of calculation at the prevailing rate.

Adjustment	$91,375.38†
Twelve Months Ended December 31st, 1932	
Actual amount paid by Company and so reflected on their books of account	$87,197.87
Based on finding of Commission	None
Adjustment	$87,197.87†
Twelve Months Ended June 30th, 1933	
Actual amount paid by Company and so reflected on their books of account	$83,573.88
Based on finding of Commission	None
Adjustment	$83,573.88†
Twelve Months Ended December 31st, 1933	
Actual amount paid by Company and so reflected on their books of account	$75,940.60
Based on finding of Commission	None
Adjustment	$75,940.60†
Twelve Months Ended March 31st, 1934	
Actual amount paid by Company and so reflected on their books of account	$77,110.16
Based on finding of Commission	None
Adjustment	$77,110.16†

† Red in copy.

Defendant's Exhibit No. 13—Continued

[fol. 4031] Regulatory Commission Expense

Twelve Months Ended December 31st, 1931		
Actual expense incurred by Company and so reflected on their books of account		$17,695.86
Based on finding of Commission and as set out on page 14 of Opinion and Order		17,695.86
Adjustment		None
Twelve Months Ended December 31st, 1932		
Actual expense incurred by Company and so reflected on their books of account		$163,739.01
Based on finding of Commission and as set out on page 77 of Opinion and Order		12,422.54
Adjustment		$151,316.47†
Twelve Months Ended June 30th, 1933		
Actual expense incurred by Company and so reflected on their books of account		$108,735.10
Based on finding of Commission that this expense should be amortized over a ten year period:		
Amortization of 1932 expense	$12,422.54	
Amortization of 1933 expense	2,667.33	15,089.87
Adjustment		$93,645.23†
Twelve Months Ended December 31st, 1933		
Actual expense incurred by Company and so reflected on their books of account		$66,792.39
Based on finding of Commission that this expense should be amortized over a period of ten years:		
Amortization of 1932 expense	$12,422.54	
Amortization of 1933 expense	5,067.55	17,490.09
Adjustment		$49,302.30†
Twelve Months Ended March 31st, 1934		
Actual expense incurred by Company and so reflected on their books of account		$56,204.18
Based on finding of Commission that this expense should be amortized over a ten year period:		
Same amortization charge used as for year 1933		17,490.09
Adjustment		$38,714.09†

[fol. 4032] Dry Hole Expense

Twelve Months Ended December 31st, 1931	
Actual amount charged and so reflected by Company's books of account	$65,871.56
Commission used average for five years ending Dec. 31st, 1931, as shown on page 12 of Opinion and Order	79,453.12
Adjustment	$13,581.56

† Red in copy.

Defendant's Exhibit No. 13—Continued

Dry Hole Expense—Continued

Twelve Months Ended December 31st, 1932		
Actual amount charged and so reflected by Company's books of account		$14,288.55
Based on finding of Commission that five year average should be used, which would be:		
Year 1928	$29,561.61	
1929	47,423.77	
1930	196,034.17	
1931	65,871.56	
1932	14,288.55	
Total	$353,179.66	
Yearly Average		70,635.93
Adjustment		$56,347.38
Twelve Months Ended June 30th, 1933		
Actual amount charged and so reflected by Company's books of account		$15,747.35

[fol. 4043] DEFENDANT'S EXHIBIT No. 15

This Agreement, Made and entered into by and between Lone Star Gas Company, a Texas corporation hereinafter styled Vendor, and Municipal Gas Company, a Texas corporation hereinafter styled Vendee,

Witnesseth:

I

That Vendor has agreed to sell and deliver to the Vendee, and Vendee has agreed to purchase and receive from the Vendor, subject to the terms, conditions, and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the following territory:

(a) Within the town or city of Iowa Park, Texas, and the suburbs thereof;

(b) Along Vendor's eighteen-inch gas pipe line extending from its junction point with Vendor's ten-inch pipe line east of Wichita Falls, Texas, to the town or city of Iowa Park.

The term of this agreement shall be for five years from November 10th, 1931.

II

The natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at Vendor's present gas measuring station near the town or city of Iowa Park, and at such other taps along the Vendor's said eighteen-inch gas transportation line between Iowa Park and Wichita Falls as shall hereafter be agreed upon in writing by the parties hereto.

Vendor agrees, at its own expense, to make for Vendee one tap on said eighteen-inch line north of Wichita Falls, but all additional taps made shall be at the expense of Vendee.

Each tap made along Vendor's said gas transportation line shall be deemed a delivery point within the meaning of this contract.

III

The natural gas to be sold by Vendor and purchased by Vendee shall be measured, with the exceptions hereinafter

provided, at the various delivery points by meters of standard type, to be installed, operated, and maintained by Vendor.

It is provided, however, that in rural sections along Vendor's said eighteen-inch gas pipe line where it is not feasible for Vendor to install and operate a master meter to measure the delivery of gas to a tap line of Vendee serving one or more domestic consumers, Vendor shall be entitled to take the monthly readings of Vendee's domestic meters on said tap line as the amount of gas sold by Vendor to Vendee at such tap. In all such cases Vendee shall afford to Vendor or its representative free access to Vendee's said domestic meters and to Vendee's records in so far as they reflect the readings of such domestic meters.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute atmospheric pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, [fol. 4044] and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries. In all cases where Vendor's measurements of gas delivered to Vendee are made by positive meters no temperature or specific gravity corrections shall be used in the computation of such gas deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of Vendor's meters becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators; one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe line at the various delivery points. The Vendee shall install, operate, and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the various delivery points at a pressure of not less than twenty pounds where such pressure is required by Vendee.

[fol. 4045]

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failures to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract, shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed

at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the 15th day of each calendar month a statement showing the amount of gas measured by Vendor's meters and delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period. The Vendee by the 12th day of each calendar month shall furnish to the Vendor a statement of the deliveries made by Vendor to Vendee on rural tap lines where Vendor has not measured the gas delivered to Vendee through a master meter.

[fols. 4046-4047] On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting, and cooking in private homes, boarding houses, apartment houses, hospitals, and charitable institutions; and this classification shall further extend to those using natural gas for *lithing* and cooking only in hotels, restaurants, bakeries, and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers the Vendor will sell and

deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not wilfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand Vendor will endeavor, in so far as operating conditions will permit, to apportion the supply of gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIII

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notices provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to the Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof in duplicate originals on this 30th day of September, 1931.

Lone Star Gas Company, by (signed) F. L. Chase, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

Municipal Gas Company, by (signed) J. B. McCabe, President.

Attest: (Signed) L. W. Cole, Secretary. (Corporate Seal, 1925, Municipal Gas Company, Texas.)

[fol. 4048] DEFENDANT'S EXHIBIT No. 16

This agreement, made and entered into by and between Lone Star Gas Company, a Texas corporation, hereinafter styled Vendor, and Municipal Gas Company, a Texas corporation, hereinafter styled Vendee,

Witnesseth:

I

The Vendor has agreed to sell and deliver to the Vendee, and the Vendee has agreed to purchase and receive from the Vendor, subject to the terms, conditions and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the towns and cities of Corsicana, Hillsboro, Waxahachie, Ennis, Cleburne, Wichita Falls, Bowie, Byers, Petrolia, Bellevue, Sunset, Alvord, Bridgeport and Decatur, Texas, and the suburbs thereof, for a term of five (5) years, commencing December 18, 1930, and thereafter until terminated by either party giving to the other party thirty (30) days written notice of termination.

II

Natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at the following delivery points:

1. At the present measuring station or stations of Vendor at each said town or city, if such measuring station is located without the corporate limits of such town or city;

2. In those cases where any present measuring station is within the corporate limits of any such town or city, then the delivery point for the gas measured at such station shall be the intersection of Vendor's pipe line, running to said station, with the corporate limits of such town or city.

III

Natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at or conveniently near the several delivery points above named, by orifice meters of standard type, which shall be installed, operated and maintained by the Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage tem- [fol. 4049] perature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of Vendor's meters becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators, one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the various delivery points. The Vendee shall install, operate and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee. [fol. 4050] The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the various delivery points at an average pressure of not less than twenty (20) pounds per square inch.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

[fol. 4051]

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time

of or previously to the making of the payment for such monthly period.

On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service and is defined as including the reasonable use of natural gas for heating, lighting and cooking in private homes, boarding houses, apartment houses, hospitals and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand,

Vendor will endeavor, insofar as operating conditions will [fols. 4052-4053] permit, to apportion the supply of available gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIII

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notice as provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof in duplicate, each copy being hereby declared an original, on this 3rd day of Dec., 1930.

Lone Star Gas Company, by (signed) F. L. Chase, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

Municipal Gas Company, by (signed) J. B. McCabe, President.

Attest: (Signed) L. W. Cole, Secretary. (Corporate Seal, 1925, Municipal Gas Company, Texas.)

[fol. 4054] DEFENDANT'S EXHIBIT No. 17

This Agreement, Made and entered into by and between Lone Star Gas Company, a Texas corporation hereinafter styled Vendor, and Municipal Gas Company, a Texas corporation hereinafter styled Vendee,

Witnesseth:

I

That Vendor has agreed to sell and deliver to Vendee, and Vendee has agreed to purchase and receive from Vendor, subject to the terms, conditions, and limitations hereinafter set out, all of the natural gas necessary to meet the require-

ments of the domestic consumers supplied by Vendee in the cities of Sherman, Denison, Denton, Whitesboro and McKinney, Texas, and the suburbs thereof, for a term of seven years, commencing December 1, 1927.

II.

The natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at the present measuring stations of the Vendor near the aforesaid cities where delivery of gas is now being made by the Vendor to the Vendee; and delivery may also be made at any measuring stations which may hereafter be established by mutual consent of the parties hereto.

III

The natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at the said delivery points by meters of standard type which shall be installed, operated, and maintained by the Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute atmospheric pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of the meters of Vendor measuring gas delivered to the Vendee becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that such meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

[fol. 4055] (b) By computing the deliveries from Vendee's corresponding check meter during the period of error or non-operation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators; one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe line at the point of delivery. The Vendee shall install, operate, and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas to the Vendee at the said delivery point at a pressure of twenty pounds per square inch.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract, shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency [fol. 4056] shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the

right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month, a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting, and cooking in private homes, boarding houses, apartment houses, hospitals, and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries, and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and indus-

trial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand Vendor will endeavor, in so far as operating conditions will permit, to apportion the supply of available gas among the [fols. 4057-4058] various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIII

All of the covenants, terms, stipulations, and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notices provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to the Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof in duplicate originals on this 28th day of November, 1927.

Lone Star Gas Company, by (signed) F. L. Chase, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

Municipal Gas Company, by (signed) J. B. McCabe, Vice-President.

Attest: (Signed) L. W. Cole, Asst. Secretary. (Corporate Seal, 1925, Municipal Gas Company, Texas.)

[fol. 4059] DEFENDANT'S EXHIBIT No. 18

This Agreement, Made and entered into by and between Lone Star Gas Company, a Texas corporation hereinafter styled Vendor, and Gainesville Gas & Electric Company, a Texas corporation hereinafter styled Vendee,

Witnesseth:

I

That Vendor has agreed to sell and deliver to Vendee, and Vendee has agreed to purchase and receive from Vendor, subject to the terms, conditions and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the City of Gainesville, Texas, and the suburbs thereof, for a term of seven years, commencing August 8, 1927.

II

The natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at the present measuring station of the Vendor near the City of Gainesville where delivery of gas is now being made by the Vendor to the Vendee.

III

The natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at the said delivery point by a meter or meters of standard type, which shall be installed, operated, and maintained by the Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute atmospheric pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of the meters of Vendor measuring gas delivered to the Vendee becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that such meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding Check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

[fol. 4060] (c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators; one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe line at the

point of delivery. The Vendee shall install, operate, and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas to the Vendee at the said delivery point at a pressure of twenty pounds per square inch.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract, shall, among other things, be considered a failure to perform a

covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency [fol. 4061] shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month, a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting, and cooking in private homes, boarding

houses, apartment houses, hospitals and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries, and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand Vendor will endeavor, in so far as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves in proper-
[fols. 4062-4063] tion to the number of domestic consumers served in each community or city.

XIII

All of the covenants, terms, stipulations, and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notices provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, ad-

dressed to the Vendor at Dallas, Texas, and to the Vendee at Gainesville, Texas.

Witness the execution hereof in duplicate originals on this 1st day of July, 1927.

Lone Star Gas Company, by (signed) F. L. Chase, Vice President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

Gainesville Gas & Electric Company, by (signed) Rufus C. Dawes, Vice-President.

Attest: (Signed) S. M. Hoch, Secretary. (Corporate Seal, Gainesville Gas & Electric Co., Gainesville, Texas.)

[fol. 4064] DEFENDANT'S EXHIBIT No. 19

This Agreement, made and entered into by and between Lone Star Gas Company, a Texas corporation hereinafter styled Vendor, and The Dallas Gas Company, a Texas corporation hereinafter styled Vendee,

Witnesseth:

I

That Vendor has agreed to sell and deliver to Vendee, and Vendee has agreed to purchase and receive from Vendor, subject to the terms, conditions, and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the city of Dallas, Texas, for a term of five years commencing June 9, 1925.

II

The natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at the following delivery points near the corporate limits of the city of Dallas:

1st. At a point on the present sixteen-inch line extending from Irving to Oak Lawn, said point to be on Lot 29, Block "C" of Forrest Park Addition to the city of Dallas.

2d. At a point on the present sixteen-inch line extending from Irving to the Union Station railway terminal, just

west of the railroad track embankment north of the Union Station.

3d. At the present measuring station on the Irving-Oak Cliff line west of Oak Cliff.

When an additional pipe line is constructed by Vendor extending from Irving, Texas, to the corporate limits of the city of Dallas, as is hereinafter provided, an additional delivery point shall be designated by agreement of Vendor and Vendee at a convenient place upon the discharge terminus of said line in proximity to the corporate limits of the city of Dallas.

III

Natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at the several delivery points by orifice meters of standard type, which shall be installed, operated, and maintained by the Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute atmospheric pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all rea- [fol. 4065] sonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and in-

spection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of Vendor's meters becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators; one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the various delivery points. The Vendee shall install, operate, and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the various delivery points at an average pressure, for any given time, of twenty pounds, it being agreed that pressures in excess of thirty pounds at the Oak Cliff measuring station shall be considered as thirty pounds in determining such average pressure. Vendee recognizes that especially in times of peak demand for gas from Vendor's pipe line system, the pressures above provided for may be materially affected by the sales of gas from tap lines on Vendor's pipe lines between the town of Irving, Texas, and the City of Dallas.

VI

The Vendor has agreed to operate, and maintain at Irving, Texas, on its Line C-2 known as the Irving-Oak Cliff line, gas compressors having a maximum capacity of 428,000 cubic feet per hour with a discharge pressure of 130 pounds. These compressors shall be operated by Vendor, upon the request of Vendee, at such times as the pressure at the present measuring station on the Irving-Oak Cliff line shall fall below twenty pounds. At any time after June 1, 1928, Vendor at Vendee's option, the option to be exercised by giving written notice, shall be required within a reasonable time to commence and complete the construction of an additional sixteen-inch pipe line extending from Irving, Texas, to the corporate limits of the city of Dallas [fol. 4066] as they then exist, at some point to be mutually agreed upon, between the northwestern part of the corporate limits of Dallas, north Oak Lawn, and the northwestern part of the corporate limits of Oak Cliff; provided, however, when and if said sixteen-inch line is completed and in operation, Vendor shall be entitled to discontinue the operation of and remove its said gas compressors at Irving, Texas.

VII

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its

pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VIII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract, shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

IX.

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

X

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month, a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all [fols. 4067-4068] gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

XI

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting, and cooking in private homes, boarding houses, apartment houses, hospitals, and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries, and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XII

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other dis-

tributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XIII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand Vendor will endeavor, in so far as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIV

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notices provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to the Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof in duplicate originals on this 15th day of May, 1925.

Lone Star Gas Company, by (signed) R. A. Crawford, First Vice-President.

Attest: (Signed) Thomas J. Uhl, Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

[fols. 4069-4070] DEFENDANT'S EXHIBIT No. 20

This Agreement Made and Entered Into by and between Lone Star Gas Company, a corporation of Texas herein-

after styled Vendor, and The Dallas Gas Company, a corporation of Texas hereinafter styled Vendee,

Witnesseth:

I

That this agreement is supplemental to and amendatory of a certain contract of date May 15, 1925, between the Vendor and the Vendee relating to the sale by Vendor and the purchase by Vendee of natural gas for domestic consumption in the city of Dallas, Texas.

II

The Vendor has agreed to commence within 90 days from the date hereof, the construction of an eighteen (18") inch natural gas pipe line extending from a point on its present pipe line system near Joshua, Texas, to a point approximately one fourth mile south of the intersection of the Dallas-Lancaster highway and the north line of the L. Horst six hundred and forty acre survey in Dallas County, Texas. The said line shall be completed within 150 days from the date hereof.

At any two points, on said pipe line, which Vendee may designate, Vendor shall install, operate and maintain orifice meters of standard type to measure gas to be delivered at such points to the Vendee; and these said points when designated by the Vendee shall be deemed delivery points to the full extent that other delivery points are designated in the said contract of May 15, 1925.

III

In consideration of the foregoing obligation of Vendor, Vendee hereby waives its right and releases its option to require Vendor to construct an additional pipe line from Irving, Texas, to the corporate limits of the city of Dallas, as is specifically set forth in Article VI of the said contract of May 15, 1925. Furthermore, Vendee agrees that upon the completion by Vendor of the pipe line extension provided in Article II hereof and the commencement of deliveries of gas to Vendee through the said pipe line the Vendor shall be relieved of any further obligation to commence and maintain any gas compressors at Irving, Texas, as is also provided by Article VI of the said Contract of May 15, 1925.

IV

Except as herein expressly recited, this agreement shall not serve in any manner to change, modify or amend the said contract of May 15, 1925, between Vendor and Vendee.

Witness the execution hereof in duplicate originals on this 14th day of August, 1925.

Lone Star Gas Company, by (signed) R. A. Crawford, First Vice-President.

Attest: (Signed) D. L. Cobb, Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

The Dallas Gas Company, by (signed) H. C. Morris, Vice-President.

Attest: (Signed) R. G. Soper, Secretary. (Seal, The Dallas Gas Company, Dallas, Texas.)

[fols. 4071-4072] DEFENDANT'S EXHIBIT No. 21

THE STATE OF TEXAS,
County of Dallas:

The existing contract between Lone Star Gas Company and The Dallas Gas Company for the sale by the former and purchase by the latter of natural gas for domestic consumption in the City of Dallas, which contract by its terms will terminate on June 9, 1930, by mutual agreement, is hereby renewed and extended for a period of five (5) years, beginning on June 9, 1930, and ending on June 9, 1935, upon all and singular the same terms, conditions and price specified and provided in said existing contract, and with the further provision that after June 9, 1935, such contract as hereby renewed and extended shall continue in full force and effect until the thirtieth day after either party shall give notice in writing to the other of termination.

Witness the Execution Hereof in Duplicate, each copy being hereby declared an original, on this 7th day of June, 1930.

Lone Star Gas Company, by (signed) Karl F. Griffith, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

The Dallas Gas Company, by (signed) H. C. Morris, President.

Attest: (Signed) R. G. Soper, Secretary. (Seal, The Dallas Gas Company, Dallas, Texas.)

[fol. 4073] DEFENDANT'S EXHIBIT No. 22

This Agreement, made and entered into by and between Lone Star Gas Company, a Texas corporation, hereinafter styled Vendor, and Community Natural Gas Company, a corporation domiciled in Dallas, Texas, hereinafter styled Vendee,

Witnesseth:

I

The Vendor has agreed to sell and deliver to the Vendee, and the Vendee has agreed to purchase and receive from the Vendor, subject to the terms, conditions and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by the distributing plants now comprising the Vendee's system, and any other distributing plants which may be added to Vendee's system by mutual agreement of the parties hereto, for a term of five (5) years, commencing January 1, 1931, and thereafter until terminated by either party giving to the other party ninety (90) days written notice of termination.

II

The delivery point of the natural gas sold by the Vendor hereunder shall be the measuring stations of Vendor located at or near the corporate limits of the towns served by it.

III

Natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at the delivery points above named, by orifice meters of standard type, which shall be installed, operated and maintained by Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating condi-

tions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor which measure the gas sold hereunder, at any time upon demand, for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatiyes. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

[fol. 4074] IV

In the event that any of Vendor's meters becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error, if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the mat-

ter shall be determined by three disinterested arbitrators, one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators, or any two of them, shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the various delivery points. The Vendee shall install, operate and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the delivery point at a pressure of not less than twenty (20) pounds per square inch.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Ven- [fol. 4075] dee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and

by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

[fol. 4076] On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas,

for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting and cooking in private homes, boarding houses, apartment houses, hospitals and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand, Vendor will endeavor, insofar as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves

in proportion to the number of domestic consumers served in each community or city.

XIII

It is agreed and understood that this contract supersedes any and all agreements for the sale of domestic gas which have heretofore been in effect between the parties hereto.

XIV

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto. [fols. 4077-4078] Notice as provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof, in duplicate, each copy being hereby declared an original, on this 15th day of May, 1931.

Lone Star Gas Company, by (signed) R. A. Crawford, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

Community Natural Gas Company, by (signed) F. L. Chase, President.

Attest: (Signed) F. L. Richardson, Asst. Secretary. (Corporate seal, Community Natural Gas Company.)

[fol. 4079] DEFENDANT'S EXHIBIT No. 23

This Agreement, made and entered into by and between Lone Star Gas Company, a corporation of the State of Texas, hereinafter styled Vendor, and the Waxahachie Gas Company, a corporation of the State of Arizona, licensed to do business in the State of Texas, hereinafter styled Vendee.

Witnesseth:

I

The Vendor has agreed to sell and deliver to the Vendee, and the Vendee has agreed to purchase and receive from

the Vendor, subject to the terms, conditions and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the town of Waxahachie, Texas, and the suburbs thereof, for a term of one (1) year, commencing July 1, 1933, and thereafter until terminated by either party giving to the other party thirty (30) days written notice of termination.

II

The gas to be sold and purchased hereunder shall be measured by a meter or meters of standard type to be installed, operated and maintained by the Vendor at the place of the delivery of said gas to the Vendee, and which place of delivery is hereby designated as being the now existing measuring station of the Vendor near the southern city limits of Waxahachie, Texas.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions. It is agreed, for the purpose of this contract, that the unit of measurement of gas delivered hereunder shall be a cubic foot at an absolute pressure of eight (8) ounces per square inch above fourteen and four tenths (14.4) pounds per square inch, and at a temperature base of sixty (60) degrees Fahrenheit; and for the purpose of payment hereunder by Vendee to Vendor it is agreed that the quantities of gas delivered shall be computed from the meter records, in accordance with Boyle's Law for volume variations due to the pressure, with an agreed flowing and storage temperature of sixty (60) degrees Fahrenheit, and for an average specific gravity obtained by tests of the gas made by the balance method.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

III

In the event that Vendor's meter becomes inoperative or manifestly in error, then the quantity of gas delivered dur- [fol. 4080] ing the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed a meter of its own as a check meter at the point of delivery.

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meter shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators, one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

IV

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the above mentioned delivery point. The Vendee shall install, operate and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor, for causes beyond its control as herein specified, shall not be liable for any pressure fluctuation at said delivery point and in no event shall be liable for control of gas pressures after delivery of the gas to the Vendee.

The Vendor will use reasonable diligence, subject to all of the limitations hereinafter set out, to deliver gas at the said delivery point at an average pressure of not less than twenty (20) pounds per square inch.

V

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the [fol. 4081] failure, depletion or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VI

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully

fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

VIII

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

In the event Vendor shall, during the term of this contract, sell domestic gas to any competitive distributing company in Waxahachie at a rate per thousand cubic feet less than the rate specified herein, then the rate herein shall be reduced to such price charged to such competitive company.

The Vendor will submit to the Vendee by the tenth day of each calendar month a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

[fol. 4082] On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

IX

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting and cooking in private homes, boarding houses, apartment houses, hospitals and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries and stores, and for heating in hotels

and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

X

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XI

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not wilfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand, Vendor will endeavor, insofar as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XII

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notice as provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, ad-
[fols. 4083-4084] dressed to Vendor at Dallas, Texas, and to the Vendee at Waxahachie, Texas.

Witness the execution hereof in duplicate, each copy being hereby declared an original on this 6th day of October, 1933.

Lone Star Gas Company, by (Signed) F. L. Chase, Vice-President.

Attest: (Signed) by T. J. Uhl, Asst. Secretary. (Seal.)

Waxahachie Gas Company, by (Signed) F. W. White, President.

Attest: (Signed) by P. L. Fordyce, Secretary. (Seal.)

Approved as to Form. K. F. G., Legal Department.

[fol. 4085] DEFENDANT'S EXHIBIT No. 24

This Agreement, made and entered into by and between Lone Star Gas Company, a Texas Corporation hereinafter styled Vendor, and County Gas Company, a Texas corporation hereinafter styled Vendee.

Witnesseth:

I

That Vendor has agreed to sell and deliver to the Vendee, and Vendee has agreed to purchase and receive from the Vendor, subject to the terms, conditions, and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by Vendee in the following territory:

(a) Within the corporate limits of the City of Dallas, Texas.

(b) In the suburbs of the City of Dallas and the territory adjacent thereto.

(c) In the towns of Arlington, Dalworth, Grand Prairie, and Highland Park, Texas, the suburbs of said towns, and the territory adjacent thereto.

(d) Along Vendor's gas transportation lines between the junction point of the old and new Fort Worth-Dallas Pike west of Arlington, Texas, and the western corporate limits of the City of Dallas; and also along Vendor's gas transportation lines between Irving, Texas, and the corporate limits of the City of Dallas.

The term of this agreement shall be for five years commencing June 9, 1925.

II

The natural gas sold and purchased hereunder shall be delivered by Vendor to Vendee at the present measuring stations on Vendor's gas transportation lines near the towns of Arlington, Dalworth, and Grand Prairie, at the other measuring stations now established where gas is being supplied by Vendor to Vendee, and at such other points along the Vendor's gas transportation lines as shall hereafter be agreed upon by the parties hereto. It is contemplated that some gas will be delivered by Vendor to the Dallas Gas Company, a corporation domiciled at Dallas, Texas, for the use and benefit of Vendee, and such deliveries shall be made at the measuring stations near the City of Dallas where the Vendor will also deliver gas to the Dallas Gas Company for the use of the said company.

Each additional tap made by Vendee along Vendor's said gas transportation lines shall be deemed a delivery point within the meaning of this contract. Additional taps may be made by Vendee along Vendor's said lines, but such taps shall not be made for individual consumers, except with the written consent of Vendor, nor shall they be located at intervals of less than five hundred feet along Vendor's said lines. In no event shall taps be made by Vendee on Vendor's pipe lines until written notice is given by Vendee to Vendor giving exact location and size of tap desired. All work done in connection with such taps shall be under the supervision and to the satisfaction of the Vendor, but at the sole expense of the Vendee.

III

The natural gas to be sold by Vendor and purchased by Vendee shall be measured, with the exceptions hereinafter provided, at the various delivery points by meters of standard type, to be installed, operated, and maintained by Vendor.

[fol. 4086] It is provided, however, that in rural sections, along Vendor's gas transportation lines where it is not feasible for Vendor to install and operate a master meter to measure the delivery of gas to a tap line of Vendee serving one or more domestic consumers, Vendor shall be entitled to take the monthly readings of Vendee's domestic

meters on said tap line as the amount of gas sold by Vendor to Vendee at such tap. In all such cases Vendee shall afford to Vendor or its representatives free access to Vendee's said domestic meters and to Vendee's records in so far as they reflect the readings of such domestic meters.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute atmospheric pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure, and with an assumed barometric pressure of 14.4 pounds absolute at the points of measurement. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries. In all cases where Vendor's measurements of gas delivered to Vendee are made by positive meters no temperature or specific gravity corrections shall be used in the computation of such gas deliveries.

The Vendee shall have access to the meters of the Vendor, which measure the gas sold hereunder, at any time upon demand for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

IV

In the event that any of Vendor's meters becomes inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or non-

operation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators; one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators or any two of them shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

[fol. 4087]

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the various delivery points. The Vendee shall install, operate, and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of the gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the various delivery points at a pressure of not less than twenty pounds where such pressure is required by Vendee.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe lines is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Vendee other than to deliver to Vendee such gas as Vendor is able to secure from its present sources of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure

2351

to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion, or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract, shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

[fol. 4088] The Vendor will submit to the Vendee by the 15th day of each calendar month a statement showing the amount of gas measured by Vendor's meters and delivered to Vendee during the preceding calendar month, together with the charts from Vendor's meters and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period. The Vendee by the 12th day of each calendar month shall furnish to the Vendor a statement of the deliveries made by Vendor to Vendee on rural tap lines where Vendor has not measured the gas delivered to Vendee through a master meter.

On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting, and cooking in private homes, boarding houses, apartment houses, hospitals, and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries, and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers the Vendor will sell and deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distribut-

ing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not willfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand Vendor will endeavor, in so far as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIII

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto.

Notices provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to the Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

[fols. 4089-4090] Witness the execution hereof in duplicate originals on this 15th day of May, 1925.

Lone Star Gas Company, by (signed) R. A. Crawford, First Vice-President.

Attest: (Signed) Thomas J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

County Gas Company, by (signed) H. C. Morris, Vice-President.

Attest: (Signed) R. G. Soper, Secretary. (Corporate Seal, County Gas Company.)

[fol. 4091] DEFENDANT'S EXHIBIT No. 25

This Agreement, Made and entered into by and between Lone Star Gas Company, a corporation of Texas, herein-

after styled Vendor, and County Gas Company, a corporation of Texas hereinafter styled Vendee,

Witnesseth:

I

This agreement is supplemental to and amendatory of a certain contract of date May 15, 1925, between Vendor and Vendee relating to the sale by Vendor and purchase by Vendee of natural gas for domestic consumption in the City of Dallas, and other points and places in Dallas County, Texas.

II

The Vendor has agreed to commence within thirty days from the date hereof, the construction of an eighteen-inch natural gas pipe line beginning at a point which is the intersection of its Line "O" with an extension of Second Avenue (sometimes called Kaufman Road) from the City of Dallas, and extending in a northwesterly direction for a distance of approximately 5560 feet to the east property line of the Southern Pacific Railroad. The said pipe line shall be completed within sixty (60) days from the date hereof.

III

By the time of the completion of the said line Vendor shall have installed and shall be ready to operate an orifice meter or meters of standard type at the junction of the said eighteen-inch tap line with the said Line "O" for the purpose of measuring gas to be delivered by Vendor to Vendee at such point, and thereafter Vendor shall operate and maintain said meter or meters for the term of this agreement; and the location of said meter or meters shall be deemed a delivery point for the sale by Vendor and purchase by Vendee of natural gas to the full extent that other delivery points are named and designated in the aforesaid contract of May 15, 1925.

IV

In consideration of the foregoing obligation assumed by Vendor, Vendee agrees to build an eighteen-inch natural gas pipe line connecting the high pressure gas distributing system in the City of Dallas with the northwest terminus of Vendor's said eighteen-inch tap line; and Vendee further agrees to have such work completed by the time Ven-

dor is ready to make deliveries of gas through its said eighteen-inch tap line.

V

When, as, and if the corporate limits of the City of Dallas are extended, prior to June 9, 1930, to include all or any portion of Vendor's said eighteen-inch tap line, then Vendee shall immediately purchase from Vendor such part of said line as is taken into or included within the corporate limits of the City of Dallas.

Any purchase, as above provided, of said tap line or any portion thereof by Vendee from Vendor, shall be made on the basis of the cost of the pipe line less depreciation accrued upon the books of the Vendor.

[fol. 4092]

VI

Except as herein expressly recited, this agreement shall not serve in any manner to change, modify, or amend said contract of May 15, 1925, between Vendor and Vendee.

Witness the execution hereof in duplicate originals, on this 21 day of September, 1926.

Lone Star Gas Company, by (signed) R. A. Crawford, First Vice-President.

Attest: (Signed) D. L. Cobb, Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

County Gas Company, by (signed) H. C. Morris, Vice-President.

Attest: (Signed) R. G. Soper, Secretary. (Corporate Seal, County Gas Company.)

[fols. 4094-4096] DEFENDANT'S EXHIBIT No. 26

THE STATE OF TEXAS,
County of Dallas:

The existing contract between Lone Star Gas Company and County Gas Company for the sale by the former and purchase by the latter of natural gas for domestic consumption in the City of Dallas and elsewhere in the counties of Dallas and Tarrant, Texas, which contract by its terms will terminate on June 9, 1930, by mutual agreement, is hereby renewed and extended for a period of five (5) years, beginning on June 9, 1930, and ending on June 9, 1935, upon all and singular the same terms, conditions and price specified and provided in said existing contract, and with the further provision that after June 9, 1935, such contract as hereby renewed and extended shall continue in full force and effect until the thirtieth day after either party shall give notice in writing to the other of termination.

Witness the Execution Hereof in Duplicate, each copy being hereby declared an original, on this 7th day of June, 1930.

Lone Star Gas Company, by (signed) Karl F. Griffith, Vice-President.

Attest: (Signed) T. J. Uhl, Asst. Secretary. (Corporate Seal, Lone Star Gas Company, Dallas, Texas.)

County Gas Company, by (signed) H. C. Morris, President.

Attest: (Signed) R. G. Soper, Secretary. (Corporate Seal, County Gas Company.)

[fol. 4097] DEFENDANT'S EXHIBIT No. 27

This Agreement, made and entered into by and between Lone Star Gas Company, a Texas corporation, hereinafter styled Vendor, and Texas Cities Gas Company, a Texas Corporation hereinafter styled Vendee,

Witnesseth:

I

The Vendor has agreed to sell and deliver to the Vendee, and the Vendee has agreed to purchase and receive from

the Vendor, subject to the terms, conditions and limitations hereinafter set out, all of the natural gas necessary to meet the requirements of the domestic consumers supplied by the distributing plants of Vendee in Waco and Paris, Texas, and any other distributing plants which may be added to Vendee's system by mutual agreement of the parties hereto, for a term of five (5) years, commencing September 16, 1933, and thereafter until terminated by either party giving to the other party ninety (90) days written notice of termination.

II

The delivery point of the natural gas sold by the Vendor hereunder shall be the measuring stations of Vendor located at or near the corporate limits of the towns served by it.

III

Natural gas to be sold by Vendor and purchased by Vendee hereunder shall be measured at the delivery points above named, by orifice meters of standard type, which shall be installed, operated and maintained by Vendor.

Gas may be delivered and measured by Vendor to Vendee at such pressures as may exist by virtue of operating conditions, but for purposes of payment therefor by Vendee to Vendor, it shall be computed on a pressure basis of eight ounces above 14.4 pounds absolute pressure, at sixty degrees Fahrenheit temperature, and without allowance for variations in atmospheric or barometric pressure. The flowing and storage temperature of the gas shall be considered as sixty degrees Fahrenheit in all measurement computations. Variations in specific gravity of the gas shall be allowed for by determining their monthly mean or average values, and which values shall be applied to the computation of deliveries.

The Vendee shall have access to the meters of the Vendor which measure the gas sold hereunder, at any time upon demand, for the purpose of inspection, and Vendee at all reasonable times may have tests or calibrations made of Vendor's meters, at Vendee's own expense and in the presence of Vendor's representatives. In the event that Vendee shall install meters to check Vendor's meters, then Vendor shall have the same rights of access to and inspection of Vendee's check meters as Vendee enjoys with reference to Vendor's meters.

[fol. 4098] IV

In the event that any of the Vendor's meters become inoperative or manifestly in error, then the quantity of gas delivered during the period that Vendor's meter was inoperative or manifestly in error shall be determined:

(a) By correcting for the error, if such error is ascertainable, during the time of the error;

(b) By computing the deliveries from Vendee's corresponding check meter during the period of error or nonoperation of Vendor's meter, if Vendee shall have installed meters of its own as check meters at the several delivery points;

(c) By estimating as nearly as may be possible the quantity of delivery from the delivery during the proportionate periods under similar conditions, when such meter was registering accurately.

In the event that Vendor and Vendee shall be unable to agree upon any adjustment for any period when Vendor's meters shall have been inoperative or in error, then the matter shall be determined by three disinterested arbitrators, one to be appointed by the Vendor, one to be appointed by the Vendee, and the two so appointed to select a third. The decision of such arbitrators, or any two of them, shall be final, and the cost of such arbitration shall be paid one-half by Vendor and one-half by Vendee.

V

The Vendor may make deliveries of gas to the Vendee at the maximum pressures carried in its pipe lines at the various delivery points. The Vendee shall install, operate and maintain such regulators and regulator stations as it may require to regulate the pressure of the gas after delivery thereof by Vendor to Vendee. It is expressly agreed that the Vendor shall in no event be liable for any pressure fluctuation at the said delivery points, or for the control of gas pressures after delivery of gas to the Vendee.

The Vendor will endeavor, subject to all of the limitations hereinafter set out, to deliver gas at the delivery point at a pressure of not less than twenty (20) pounds per square inch.

VI

The Vendee expressly recognizes that the production and transportation of natural gas by pipe line is subject to accidents and interruptions, and diminutions of pressure and supply. The Vendor undertakes no obligation toward Ven- [fol. 4099] dee other than to deliver to Vendee such gas as Vendor is able to secure from its present source of supply and such other sources of supply to which it may extend its pipe line system. It is expressly agreed between Vendor and Vendee that Vendor shall not be liable to the Vendee for any failure to deliver gas hereunder, when such failure is occasioned by accidents to or breakage of pipe lines or machinery, diminution or failure of supply occasioned by the failure, depletion or destruction of gas wells or fields, fires, floods, strikes, riots, explosions, act of God or the public enemy, or, and without limitation by enumeration, any other cause beyond the control of the Vendor.

VII

It is expressly covenanted and agreed by and between the parties hereto that if either party shall fail to perform any of the covenants or obligations imposed upon it under and by virtue of this contract, then the party offended shall have the right and option to cancel and terminate this contract upon giving the offending party written notice of the violation of such covenant or obligation, and such notice having been given, if the violation complained of is not remedied within ten days, then the termination of this contract shall be deemed complete. The failure of the Vendee to make payments to the Vendor for gas purchased in accordance with the provisions of this contract shall, among other things, be considered a failure to perform a covenant or obligation of this contract and entitling the Vendor to cancel and terminate the contract.

VIII

It is further covenanted and agreed that if any court, Governmental regulatory body, or Governmental agency shall subject to review the price to be paid by Vendee for gas purchased from Vendor hereunder, and shall lawfully fix or establish another and different price for such gas, then if said price shall be fixed at any figure less than the price herein provided for, the Vendor shall have the right

and option to cancel and terminate this agreement by giving written notice to the Vendee; and if said price shall be fixed at any figure more than the price herein provided for, then the Vendee shall have the right and option to cancel and terminate this agreement by giving written notice to the Vendor. Such written notice when given by either party shall make the termination of this contract complete.

IX

The price to be paid by Vendee to Vendor for the gas sold and purchased hereunder shall be at the rate of forty (40¢) cents per thousand cubic feet.

The Vendor will submit to the Vendee by the fifteenth day of each calendar month a statement showing the amount of gas delivered to Vendee during the preceding calendar month, together with charts from Vendor's meters, and the computation of deliveries for such period. These charts and computations shall be returned to Vendor at the time of or previously to the making of the payment for such monthly period.

[fol. 4100] On or before the twentieth day of each calendar month Vendee shall pay to the Vendor at Dallas, Texas, for all gas delivered by Vendor to Vendee during the preceding calendar month according to the gas measurements and computations hereinbefore provided for.

X

By domestic consumers, as used in this contract, is meant all those consumers using gas in domestic service, and is defined as including the reasonable use of natural gas for heating, lighting and cooking in private homes, boarding houses, apartment houses, hospitals and charitable institutions; and this classification shall further extend to those using natural gas for lighting and cooking only in hotels, restaurants, bakeries and stores, and for heating in hotels and buildings where separate rooms are dependent upon natural gas for heating purposes in grates and stoves.

XI

It is understood that, in addition to the gas which Vendor shall deliver to Vendee hereunder to meet the requirements of Vendee's domestic consumers, the Vendor will sell and

deliver to the Vendee and the Vendee will purchase and receive from the Vendor gas for manufacturing and industrial purposes, under such terms and conditions as may hereafter be agreed to in writing by the Vendor and the Vendee; provided that in the judgment of the Vendor sufficient gas is available to warrant its sale for such purposes.

Vendee shall be entitled to receive industrial gas from Vendor at such times as Vendor is selling to other distributing companies who are receiving industrial gas from Vendor under substantially similar operating conditions.

XII

It is understood that during the term of this contract Vendor will supply gas to various other communities and cities, and Vendor agrees that it will not wilfully discriminate in favor of such other communities or cities or against Vendee or Vendee's domestic or industrial consumers in the matter of the apportioning of the supply of gas which Vendor has available. In times of extreme or peak demand, Vendor will endeavor, insofar as operating conditions will permit, to apportion the supply of available gas among the various communities and cities which it serves in proportion to the number of domestic consumers served in each community or city.

XIII

It is agreed and understood that this contract supersedes any and all agreements for the sale of domestic gas which have heretofore been in effect between the parties hereto.

XIV

All of the covenants, terms, stipulations and provisions of this contract shall extend to and be binding upon the respective successors and assigns of the parties hereto. [fols. 4101-4102] Notice as provided to be given hereunder shall be deemed sufficiently given and served when and if deposited in the United States mail, postage prepaid and registered, addressed to Vendor at Dallas, Texas, and to the Vendee at Dallas, Texas.

Witness the execution hereof, in duplicate, each copy being hereby declared an original, on this 15 day of Sept., 1933.

Appraisal

Cost of Reproduction New

January 1, 1933

Public Service Plant, Property and Business

Exclusive of Fort Worth Division

P. McDonald Biddison, E. A. Steinberger, Ed. C. Connor, Engineers, Dallas, Texas

[fols. 7867-7868] Preliminary Development and Organization Costs, Undistributed General Costs, Going Value, and Cash Working Capital

General Summary

Preliminary Development and Organization Costs	$4,474,272
Undistributed General Costs	9,241,074
Going Value (Cost of Business Development)	7,792,888
Cash Working Capital	1,701,600
Total	$23,209,834

[fol. 7869] Scope of the Report

Any proper estimate of the reproduction cost of the property and business of Lone Star Gas Company must include all expenditures that would necessarily be incurred in the reproduction of an identical property and its attached business at the approximate date of the investigation. These expenditures, due in some measure to the sequence in which they would be incurred, but to a greater degree to certain inherent differences between them, logically fall into five general groups.

1. Preliminary development costs.
2. Organization and corporate costs.
3. Direct structural costs.
4. Undistributed general costs.
5. Cost of business development.

That portion of this appraisal that deals with direct structural costs, or the reproduction costs of the various units of physical property, is confined to the items of expense that can be definitely allocated to specific property accounts. All of the costs involved in this determination begin and end with the so-called construction period.

It is evident that no large natural gas enterprise, consisting, as does Lone Star Gas Company, of a highly complex and extensive system of natural gas production, transportation and marketing facilities, could be initiated by the digging of a ditch and the laying of pipe. Far in advance of any actual construction, the feasibility of the project would first be determined and the construction decided upon by a group of men experienced in the natural gas business, [fol. 7870] and capable of carrying through to successful completion a new enterprise that involved the expenditure of more than sixty millions of dollars. This preliminary step in itself would be the result of extensive investigations, and the acquisition of potential and producing natural gas reserves. A corporate organization would be perfected, and the necessary funds secured with which to construct the physical plant, provide for interest and taxes during construction, the cost of administrative, legal, engineering, supervisory and other general expenses during construction, as well as the funds that would be required for fixed charges during the period of business development.

An organization would be perfected that would function prior to and during the construction period. Additional leases and gas purchase contracts would be secured, detail market analyses and final engineering plans would be prepared, gas sales contracts would be negotiated, and negotiations for the purchase of materials and the letting of contracts would be entered upon.

This brief summary sets out in a general way some of the steps that would necessarily be taken, and some of the expenditures that would necessarily be made in advance of actual construction in connection with the reproduction of the property and business of Lone Star Gas Company.

As has been previously noted, that portion of this report that deals with the reproduction cost of the physical property of Lone Star Gas Company is confined to the cost of material, the cost of installation and such other costs as can be definitely allocated to specific property accounts. When an inventory has been prepared including every item of

physical property which enters into the construction of the [fol. 7871] system, and when a proper price has been applied to every item of inventory covering both the expense of acquiring the items of property and putting them in place as a part of the system, the result does not represent the entire cost of the physical property itself. This is true for the reason that in addition to these direct structural costs, charges would be incurred for expenses during construction so general in their nature as to prohibit a rational allocation of them to specific property items. These general or undistributed costs would consist of the salaries and expenses of the administrative and legal departments, the engineering and general construction supervisory departments, and other more or less subordinate groups. Money would be provided for all expenditures and the interest on the money represented by the expenditures for elements of property that had not passed into operation would be an outlay in addition to the capital expended, as would also be the taxes that would accrue on non-operative property during the construction period.

Upon the completion of a natural gas project of this character, the acquisition of the volume of sales now enjoyed by Lone Star Gas Company, by reason of business development that has extended over a period of more than twenty years, would be the result of a gradual process that would extend over a number of years subsequent to the construction of the physical elements of such a plant. During this period of business acquisition, a substantial portion of the completed plant would be idle in comparison with its capacity for service, measured by the actual deliveries of gas on the part of Lone Star Gas Company. The so-called fixed charges, or expenses for interest, taxes and depreciation, would accrue on this completed plant irrespective of [fol. 7872] the amount of business actually done. The difference between the earnings of the completed plant during this period of business development and the actual earnings of Lone Star Gas Company is a fair measure of the cost of reproducing the business of Lone Star Gas Company as distinguished from the cost of reproducing its physical property.

This portion of the appraisal is confined to an estimate of the expenses that would necessarily be incurred during the preliminary development and organization periods, to the

general and undistributed charges that would be incurred prior to, during and subsequent to the construction period, and to the cost of business acquisition during the development in the reproduction of the property and business of Lone Star Gas Company as of January 1, 1933.

These elements of expense cannot be inventoried with the same degree of precision as can the physical items of property, nor can they be priced from discount sheets or manufacturers' quotations. They are, nevertheless, an inescapable and substantial part of the costs that would be incurred in the reproduction of Lone Star Gas Company, and as such, they contribute proportionately to the present worth or value of the property. The necessity for an accurate determination of the amounts that would be involved in these factors is co-ordinate in importance with the necessity for an accurate determination of the amounts that would be involved in the reproduction of the physical property itself.

In order that the estimate of the preliminary general and development costs may have a rational basis, it will be necessary to determine the sequence of the various steps that would be taken and the time and the personnel that [fol. 7873] would be required for each step. It will also be necessary to determine the proportionate part of the total cost that would be made at specific dates as the reproduction program proceeded, and to fix the various undistributed charges with relation to the basis upon which the reproduction cost of the direct expenses is predicated.

In that portion of this appraisal that deals specifically with the direct costs of the physical property, it has been assumed that the company would organize its own construction forces, and build the plant without the services of a general engineering contractor. This assumption, which follows the general practice of Lone Star Gas Company in the historical development of its physical property, affects the general and undistributed charges in several particulars. The contractor's profit is eliminated from the structural costs, and the duties that would otherwise be absorbed by the engineering contractor are transferred to the administrative, engineering, and supervisory organization of the company. Throughout the preparation of these estimates, the actual experience of Lone Star Gas Company has been used as a basis whenever that experience has been applicable

to the phase of the estimate under consideration. In the matter of the preliminary development, organization and corporate costs, this method could not be applied on account of the discrepancy between the size of the project at the date of its historical inception and the size of the project at the date of this appraisal, and on account of the unique financial structure of Lone Star Gas Company which could not be used as the basis for financing at the present time.

In all other particulars, the personnel of the company actually engaged in the work that would be involved in the [fols 7874-7875] general undistributed costs in reproduction has been used in fixing the overhead costs, and the actual permanent engineering and geological records of the company, and the time and the personnel actually required to prepare these records have been used as the basis for the estimate of the reproduction cost of these records. By the use of these methods, the element of speculation that so frequently becomes predominant in estimates of this nature is practically eliminated.

[fol. 7876] Preliminary Development and Organization Costs

General Summary

Preliminary Geoligical Investigation	$114,444
Preliminary Engineering Investigation	49,695
Detailed Geological Work—One Year	78,420
Fiscal Agent's Geological Check	15,000
Fiscal Agent's Engineering Check	15,000
Fiscal Agent's Title Certification	25,000
Undistributed Production Expenses	39,944
Organization and Corporate Expenses	141,769
Marketing Cost First Mortgage Bonds	1,140,000
Marketing Cost Preferred Stock	855,000
Remuneration for the Originating Group	2,000,000
Total	$4,474,272

(Note.) The above summary does not include the fair market value of gas lands, gas leases, rights and options, nor the cost of producing gas wells transferred by the originating group to the corporation.

[fol. 7877] Preliminary Development and Organization Costs

General Definitions:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company, Preliminary Development and Organization Costs are intended to cover all expenditures that would necessarily be made by the originators of a natural gas production and transportation company identical with Lone Star Gas Company in connection with promoting the enterprise, interesting capital therein, and incorporating the company.

In the classification of investment (fixed capital account) in road and equipment of steam roads prescribed by the Interstate Commerce Commission, organization expense is defined as follows: "This account shall include all fees paid to governments for the privilege of incorporation, and office and other expenditures incident to organizing the corporation and putting it in readiness to do business; the cost of preparing and distributing prospectuses; cost of soliciting subscriptions for stock; cash fees paid to promoters, and the actual cash value (at the time of the organization) of securities paid to promoters for their services in organizing the enterprise; special fees; cost of preparing and issuing certificates of stock; cost of securing the necessary permits from State authorities and other like costs."

In Des Moines Gas Company V. Des Moines (238 U. S. 153) the United States Supreme Court gave a more general definition of this same element of cost and at the same time laid down the general rule to be followed in estimating this expense in connection with reproduction cost estimates. The definition and the rule are as follows: "A [fol. 7878] money expenditure in the promotion of an enterprise and in interesting capital therein including also legal expenses, obtaining the necessary franchise, as well as the cost of incorporating the company * * * It is not a question of what was actually expended therefor in the plant in question, but what it would cost to reproduce a similar plant at the present time."

Basic Assumptions:

Before proceeding to analyses of the preliminary development and organization costs that would be incurred in the

reproduction of Lone Star Gas Company, it will be necessary first to point out certain fundamental differences between the preliminary and development stages of a natural gas enterprise and those of any other public utility business; second, to outline the assumptions upon which this estimate is based; and third, to establish the chronological order in which the various initial steps would be taken.

A natural gas project is fundamentally a mining venture, and its successful completion and growth into a going concern is primarily dependent upon the result of a discovery of gas and upon the subsequent consolidation and development of sufficient gas reserves to justify the expenditure of large sums of money for transportation facilities. In conjunction with this discovery, there must be available within definite geographic limits a market for this gas. The size of this market, the possibilities for future growth, and the characteristics of the load, together with the probable volume of reserves, will determine the amount of the investment in pipe line and compressor station capacity.

The preliminary development of a project with these characteristics would be a much more complex and hazardous [fol. 7879] venture, for example, than the preliminary development of an electric power transmission system. In the case of the latter, a simple engineering determination of the proper location and capacity of a power plant in connection with a market survey would be the extent of the necessary preliminary work. There would be no necessity for the demonstration of the existence of a primary supply, nor would there be any necessity on the part of the originators for the acquisition, consolidation and development of a primary supply in order to secure the success of the venture.

For these and many other reasons that readily suggest themselves, the originating group of an enterprise identical with Lone Star Gas Company would be called upon to assume risks, and make intensive investigations and large investments far in advance of any permanent financing and corporate organization.

Insofar as the time that would be involved and the expense that would be incurred in preliminary development and corporate organization in reproducing Lone Star Gas Company, the history of Lone Star Gas Company affords no proper basis for estimate. The discrepancy between the extent of Lone Star Gas Company at the time of its incep-

tion and corporate organization, and the extent of the property at the date of this valuation, together with the dissimilar conditions in reference to financing that existed in 1909 compared with those existing in 1933, precludes the rational use of any historical date.

Certain assumptions must therefore be made that take into consideration the normal steps that would be taken, as of this date, in initiating the project and in creating the corporate entity. These basic assumptions are predicated [fol. 7880] upon an exact knowledge of the property itself, and upon the actual history of the various preliminary development and corporate organization of other large natural gas pipe line projects that have been promoted and constructed within the last few years.

It has been assumed:

1. That all natural gas development insofar as this development has been the result of direct exploration on the part of Lone Star Gas Company, or has been the result of the availability of Lone Star Gas Company as marketing agency, would be non-existent at the date of the initiation of the project.

2. That the market for the sale of natural gas, both domestic and industrial, insofar as this market has been created as the result of the construction of the pipe line system of Lone Star Gas Company, would be a potential market only at the date of the initiation of the project.

3. That all geological information secured by direct exploration on the part of Lone Star Gas Company, by the research of its geological department, or by the availability of Lone Star Gas Company as a marketing agency would be non-existent at the date of the initiation of the project.

4. That all engineering information in possession of Lone Star Gas Company, in reference to its markets, the rate of consumption and other factors affecting the sale of natural gas and the design and location of its pipe lines and compressor stations, would be non-existent at the date of the initiation of the project.

5. That the originating group capable of the successful promotion of a company identical with Lone Star Gas Com-

pany would consist of not less than four individuals, with substantial financial connections and wide experience in the natural gas business.

6. That the originating group would provide for all expenditures made prior to the date of permanent financing.

7. That the originating group would conduct all negotiations with the fiscal agents selected as underwriters; would perfect a corporate organization; and would furnish the equity provided by the financial structure agreed upon.

[fol. 7881] 8. That the financial structure would be based upon the issuance of 50% of the total sum required in first mortgage bonds, 25% in preferred stock, and 25% in common stock.

9. That the originating group would transfer to the corporation at the date of incorporation, and at their fair market value, all leaseholds, gas rights, gas purchase contracts and/or options, and all producing gas wells purchased or drilled by them during the development period.

10. That the originating group would be reimbursed for their services in connection with the promotion of the enterprise, for their out-of-pocket expenses for reports and fees, and for the market value of the assets transferred by them to the corporation from the proceeds of the sale of bonds.

11. That the time involved from the initiation of the enterprise to date of incorporation would be one and one half years.

Sequence of Preliminary Steps:

It is obvious that the initial step in the reproduction of Lone Star Gas Company would be a decision on the part of the originating group to construct a pipe line system to serve the markets now served by Lone Star Gas Company, provided an adequate supply of natural gas could be secured within commercial distances of these markets.

In the preparation of this estimate an attempt has been made to follow in logical order the normal sequence of events that would follow this decision and finally result in the perfection of a corporate organization that would carry the project through the pre-construction, construction, and business development periods.

It has been assumed that following the decision to pro-
[fol. 7882] ceed with the project, the originating group would begin the acquisition of a part of the gas reserves now held by Lone Star Gas Company and a partial development of these reserves for the purpose of testing the extent of their probable production. Gas purchase contracts and/or options to purchase gas would be secured from the owners of producing gas wells, and options would be secured on additional acreage. The basis for the acquisition of these reserves would be, in part, a general geological survey covering a substantial part of Texas, Southern Oklahoma, Southeast New Mexico, and Northwest Louisiana made by a firm of nationally known geologists.

In connection with the acquisition and partial development of reserves, a preliminary engineering survey would be made of the prospective markets and an estimate prepared of the probable cost of the pipe line system. Negotiations would be begun with potential consumers, and the owners of manufactured gas plants located in the larger cities for the purpose of securing a market for natural gas.

It has been assumed that at this juncture the economic feasibility of the project as a whole would have been demonstrated by the results of the geological investigation, the drilling tests and the findings of the engineering survey.

During the preliminary period, offices would be maintained at Dallas, and the member of the originating group, who would ultimately become the executive head of the corporation when organized, would be on the ground directing an organization that would be active in making detail geological investigations, securing additional acreage and gas purchase contracts, the drilling of additional wells, the
[fol. 7883] preparing of sales contracts, and the beginning of detail plans and estimates for construction.

Throughout the progress of this work other members of the originating group would have begun negotiations with responsible fiscal agents for the purpose of securing commitments for a substantial part of the funds that would be required for the completion of the project and the payment of fixed charges during the development period.

Before these commitments could be secured, the underwriting group would require at least three independent re-

ports based upon engineering, geological, and legal investigations.

The engineering survey and report would be made by some nationally known engineering firm, or by some engineer familiar with natural gas projects and favorably identified with the industry. This survey would consist of a general survey of the markets, together with an estimate of the probable sales, both domestic and industrial, in the area proposed to be served, an estimate of operating expenses, an estimate of the cost of construction, and a check of the report prepared by the engineers of the originating group.

The geological survey would cover a study of all probable sources of gas supply commercially available to the prospective markets, together with a detail check of all geological data in possession of the originating group. This survey and report would also be made by a firm having national standing as geologists familiar with natural gas production.

The legal report would cover an opinion on the validity of title of all lands held in fee, leaseholds and gas purchase [fol. 7884] contracts, the examination of all contracts, tentative or closed, for the sale of gas, and an investigation of all regulatory legislation affecting the transportation and sale of natural gas.

In each case the firms or individuals making these reports would be selected by the fiscal agents. All fees and expenses incurred in their preparation would be borne by the originating group.

Upon the basis of favorable reports resulting from the results of the geological, engineering, and legal investigations, final commitments for financing would be secured from the fiscal agents, and corporate organization would proceed upon the basis of a financial structure mutually agreed upon by the originating group and fiscal agents.

At this point, the preliminary development period would end and the expenses attributable to this period would cease. Simultaneously the period of corporate organization would begin and the expenses incurred in connection with setting up of the corporate structure and placing it in readiness to do business would be directly chargeable to organization expense and corporate costs. Upon the perfection of the corporate organization, the direction of the affairs of the

project would pass from the originating group into the hands of the duly elected officers of the corporation and the organization that would function throughout the construction program would be perfected.

Estimate of Cost:

In order to properly estimate the costs that would be involved in the reproduction of Lone Star Gas Company dur- [fol. 7885] ing the preliminary development period, several basic factors must be taken into consideration.

1. The time that would be involved from the beginning of the development of the project to the completion of permanent financing and corporate organization.

2. The total cost and extent of the project.

3. The value of the capital assets delivered to the corporation by the originating group.

4. The value of the information secured in connection with the several geological and engineering investigations.

5. The out-of-pocket advances made by the originating group during the development period.

6. The proper remuneration for the services of the originating group.

The last item of cost must be measured by the risks that would be involved in promotion, the type of personnel that would be required of an originating group for the successful promotion of an enterprise identical in all respects with Lone Star Gas Company as it now exists, the extent of the work and expenses that would be required of the originating group in connection with securing gas purchase contracts and gas sales contracts, and the extent to which the originating group would participate in the permanent financing of the corporation.

As previously noted, the initial steps in the development program would be the acquisition by the originating group of a substantial part of the acreage now owned or held under lease by Lone Star Gas Company, the acquisition of gas purchase contracts, or options for the purchase of gas [fol. 7886] from producing gas wells, the accumulation of definite information relative to the possibilities for sales in the existing markets, and preliminary estimates of the

cost of construction of a pipe line system adequate to serve these markets.

Preliminary Geological Investigation:

The following resume sets out in detail the scope and estimated cost of the geological survey that would be required in order to determine the feasibility of constructing a natural gas transportation system identical with Lone Star Gas Company, and provide a basis for the initial acquisition of acreage. As before stated, this preliminary report would be made by a firm of nationally known geologists in order that the findings might be used as the basis for negotiations with fiscal agents. Upon the completion of this survey, the services of this firm would be dispensed with, and the detail geological work taken up by a geological organization working under the direction of the originating group.

Extent of the Survey:

The area that would necessarily be incorporated in this survey would include all the territory within approximately four hundred miles of the City of Fort Worth, Texas. Specifically the area would include:

1. The Southern half of the State of Oklahoma.

2. All of Texas except a part of the Gulf Coast.

3. The Southeastern one-fourth of the State of New Mexico.

[fol. 7887] 4. The gas producing areas of the State of Louisiana.

Certain portions of these four areas would not require attention for geological and other reasons that would be well known to geologists of experience. The areas that would be omitted from the general investigation for these reasons would include the mountainous regions, major synclinal troughs, territory already proved barren of gas by reason of past explorations, and depleted gas fields.

Time Required:

A period of at least six months, or one hundred and eighty days, would be required for this undertaking, and the per-

sonnel required would be assigned in conformity to this schedule. A longer period of time in conjunction with a smaller personnel would be preferable to the schedule used in this estimate, and the larger personnel that this schedule would require for the reason that this arrangement would permit increased familiarity on the part of the field parties with the respective areas assigned to them, and as a consequence the finished report would be more thorough and accurate. The overall cost of either method would be approximately the same.

The element of time is always a matter of importance in development programs, and for this reason the six month schedule with the appropriate personnel has been adopted.

The personnel that would be required for an accurate and worth while survey of the area outlined above and within the time allotted would be as follows:

[fol. 7888] One chief geologist in charge of investigations.
One automobile.

Field Party, Sou. Oklahoma	Field Party, Tex. Panhandle	Field Party, W. Tex. & N. Mex.
1 Geologist	1 Geologist	1 Geologist
1 Asst. Geol.	1 Asst. Geol.	1 Asst. Geol.
1 Inst. man	1 Inst. man	1 Inst. man
1 Auto and equipment	1 Auto and equipment	1 Auto and equipment

Field Party, All Other Areas	Office Force
1 Geologist	2 Draftsmen
1 Asst. Geol.	3 Clerks
1 Inst. man	
1 Auto and equipment	

Expense:

Chief geologist per diem and expenses		$100.00
Four field parties each per day		
Living expenses	$12.00	
Geologist	35.00	
Ass't. geologist	25.00	
Instrument man	20.00	
Auto expense	7.50	
Equip. and incidentals	5.00	
Total each party	$104.50	
Total four parties		418.00

Office force	25.00
Office rent	5.00
Miscellaneous expense (Stationery, supplies, drawing materials, telephone calls, telegrams, etc.)	30.00
Total expenses per day	$578.00
Working days 180	$104,040.00
Firm fee 10% of cost	10,404.00
Total Preliminary Geological Expense	$114,444.00

Data:

Data secured as a result of the geological survey, described above, would be as follows:

[fol. 7889] (1) Complete maps showing:

(a) All gas fields within distances feasible for pipe line connection.

(b) All individual gas wells within a like distance.

(c) Distances between actual existing sources of gas and principle markets to be supplied.

(d) Approximate outline of structural conditions, and kinds of structures in and around all above mentioned gas fields and wells.

(e) Reconnaissance surveys of all lands, within the area outlined above, that have possibilities of producing gas.

(f) Topographic and stratigraphic conditions of areas through which pipe lines would have to pass.

(g) Cross-sections and charts showing sand thicknesses, character of producing formations, dips, etc.

(2) Individual and total open flow and rock pressure figures, together with logs, elevations, and names of producing formations of all existing gas wells shown on maps.

(3) List of gas wells subject to gas purchase contracts, including names and addresses of owners.

(4) Charts showing production of all gas wells and decline curves on same (if available).

(5) Estimates of total recovery of gas from existing gas fields and wells.

(6) Estimates of probable extensions of existing gas fields and areas around individual or isolated gas wells.

(7) Recommendations and conclusions by which acquisition of, and expenditures for gas wells, gas purchase contracts, lands and leases should be governed. Also preliminary data by which engineers should be guided in surveying for pipe lines.

During the progress of the preliminary geological survey, and upon the basis of its affirmative findings as it progressed, three definite steps would be taken simultan- [fol. 7890] eously in connection with the development of the project.

First, a firm of nationally known engineers would be engaged for the purpose of making a market survey, a general design of a pipe line system that would connect the more promising gas areas as indicated by the geological report and the markets, a preliminary estimate of the cost of the system, and a preliminary estimate of probable earnings and

Second, offices would be opened at Dallas, Texas. A member of the originating group would establish permanent quarters at Dallas, Texas, a geological force would be organized to proceed with a detailed investigation of the area covered by the preliminary report, and an organization would be perfected for the purpose of securing leases, gas purchase contracts and/or options, and testing the acreage as secured.

Third, other members of the originating group would be making preliminary contacts with fiscal agents for the purpose of securing tentative commitments for permanent financing.

Preliminary Engineering Investigation:

The following resume sets out the scope and the estimated cost of a preliminary engineering investigation that would determine the extent of the market, the probable earnings, the general design and cost of construction, and the probable operating expenses of a natural gas pipe line system identical with that of Lone Star Gas Company as of January 1, 1933.

Scope of the Investigation:

(1) Market analysis:

Lone Star Gas Company now serves at wholesale six groups of cities and towns located in Texas and Southern [fol. 7891] Oklahoma as follows:

1. Dallas and County Gas Companies.
2. Fort Worth Division Lone Star Gas Company.
3. Community Natural Gas Company.
4. Texas Cities Gas Company.
5. Municipal Gas Company.
6. Main Line Towns.

The total number of individual cities and towns in each groups is as follows:

Distributing Groups	No. Cities or Towns
1. Dallas and County Gas Companies	5
2. Fort Worth Division Lone Star Gas Co.	1
3. Community Natural Gas Company	237
4. Texas Cities Gas Company	2
5. Municipal Gas Company	21
6. Main Line Towns	4
Total Cities and Towns Served	270

The market analysis would consist of a study of larger markets, and a more or less general study of the lesser markets. A general industrial survey of the area as a whole would be made. This survey would include an actual check on the fuel consumption of the major industrials, the load characteristics of these industrials together with a schedule of industrial rates for gas for groups and individual consumers that would probably secure the business. It would also include a more general survey of the smaller industrials, an estimate of the volume of sales and revenue that might be derived from this group as well as a study of its load characteristics.

The domestic survey would consist of an estimate of the number of domestic consumers that might be secured in all [fol. 7892] cities and towns served and a detail study, based on temperature records, of the annual consumption that might be developed from domestic consumers, and a detail estimate of the probable peak requirements of the domestic

group. In connection with this study, estimates would be made of the probable rates of growth of all cities and towns proposed to be served.

(2) General plan and estimate of cost:

Upon the basis of the market analysis, together with the results of the geological survey, the size and location of the component parts of the transmission system, including compressor stations, would be tentatively worked out and an estimate of cost prepared.

(3) Estimate of operating expenses:

This estimate would consist largely of a study of the probable cost of gas, the cost of compression, and a general study of administrative and other operating charges.

Personnel:

The work would be carried on by a chief engineer and his office assistants located in Dallas, Texas, and several field parties that would be engaged in securing the basic data that would be assembled and correlated by the office organization.

In estimating the personnel that would be required for the field work, the general grouping by companies has been followed.

[fol. 7893] The approximate number of domestic meters in place for each group as of January 1, 1933, was as follows:

1. Dallas and County Gas Companies	70,956
2. Fort Worth Division Lone Star Gas	39,181
3. Community Natural Gas Company	78,214
4. Municipal Gas Company	32,759
5. Texas Cities Gas Company	13,973
6. Gainesville Gas and Electric Co.	2,642
7. Waxahachie Gas Company	1,079
8. Southwestern Light and Power Co.	304
Total Domestic Meters in Place	239,108

The approximate number of industrial consumers served by Lone Star Gas Company, all groups, was 1300 as of January 1, 1933.

Due to the reliable information that would be available from Chambers of Commerce and other sources in the larger cities, the necessary data could be secured more rapidly in these larger cities than in the widely distributed smaller

towns of the Community Natural Gas Company, and Municipal Gas Company groups.

The Dallas and County Gas Companies group would require at least sixty days for one competent investigator, the Fort Worth Division Lone Star Gas Company forty five days for one investigator, and the Community Natural Gas Company group two hundred and thirty seven man days or at least one man day per town served, the Municipal Gas Company group three man days per town served or a total of sixty three man days, the Texas Cities Gas Company group fifteen man days, and all other towns ten man days or a total of four hundred and thirty man days for the field work.

Time Required:

The report would be completed within ninety working days.

[fol. 7894] Inasmuch as the general design and estimates of cost would be of a preliminary character, a general reconnaissance only would be required of the engineer in charge. This reconnaissance would consist of a trip over all sections of the proposed system for the purpose of viewing the terrain, inspecting possible river crossings, and prospective compressor station sites. Contacts would be made with various manufacturers and supply houses for the purpose of securing tentative quotations on the various items of property that would enter into the construction of the plant.

Estimated cost of the investigation:

1. Office Expense				
Chief engineer in charge	90 days	@	$100.00 per day	$9,000.00
Four office engineers	360 days	@	35.00 per day	12,600.00
Stenographic work	3 Mo.	@	300.00 per Mo.	900.00
Office rent	3 Mo.	@	150.00 per Mo.	450.00
Office expense and supplies	3 Mo.	@	500.00 per Mo.	1,500.00
Auto expense engineer in charge				300.00
2. Field Expense				
Field engineer Dallas	60 days	@	$50.00 per day	$3,000.00
Field engineer Ft. Worth	45 days	@	50.00 per day	2,250.00
Field engineers	325 days	@	25.00 per day	8,125.00
Auto expense Dallas 1 car	2 Mo.			200.00
Auto expense Ft. Worth 1 car	1/2 Mo.			150.00
Other auto expense 6 cars	3 Mo.			2,700.00
3. General Expenses				
Expense	880 man days	@	$4.00 per day	$3,520.00
Firm fee				5,000.00
Total Estimated Expenses				$49,695.00

The primary objective of the originating group, the existence of ample gas reserves within commercial distances of [fol. 7895] the available markets having been determined by the preliminary geological survey, would be the creation of a corporate organization, properly financed by means of which the actual construction of the plant and its subsequent operation might be effected.

Before giving consideration to the financing of a Natural Gas project identical with Lone Star Gas Company as of January 1, 1933, responsible fiscal agents would require of the originating group definite assurance of an ample gas supply. A geological report indicating the existence of this supply even though prepared by a firm of national standing would be insufficient for a preliminary consideration of the project unless supported by a substantial ownership of leases, gas purchase contracts and/or options.

The engineering report covering estimates of cost and market analyses, while essential to the final negotiations, would be subordinate at this stage of the development for the reason that the individuals of the originating group, experienced in the natural gas business, would be able to anticipate in a general way the results of its findings.

In view of these facts, the assumption is made that the work in connection with the detailed geological investigations, the acquisition of acreage, and the drilling of wells would be vigorously pushed immediately upon receipt of favorable findings as the preliminary geological report progressed. This assumption leads to a consideration of the cost that would be involved in the detailed geological work that would be used as the basis for the selection of this acreage and the location and drilling of wells. This detailed [fol. 7896] geological work should be continued without interruption throughout the development and organization periods into the construction period. In connection with this phase of the estimate, only those expenses that would be incurred up to the date of the completion of corporate organization will be considered.

Basis of the Estimate:

The basis for the following estimate, and the outline of the scope of work that would be done in connection with the detailed geological work, is the estimated cost of reproduction within a period of four years of all geological data

and records and reports in possession of Lone Star Gas Company as of January 1, 1933.

Personnel:

The personnel required to begin operations when the preliminary geological survey had been completed and to bring all files, records, reports and other geological information now in possession of Lone Star Gas Company up to its present status, within a period of four years would be as follows:

One chief geologist in charge of all operations.
Four field geologists.
Four assistant geologists.
One paleontologist.
Two draftsmen.
Two clerks.

The chief geologist, paleontologist, draftsmen and clerks would have headquarters in Dallas, Texas, and would be provided with suitable offices and the necessary equipment with which to carry on the work.

[fol. 7897] Scope of the Work:

The duties of the chief geologist would be the supervision of all operations of the geological departments in the field and in the office. He would recommend or reject all work done in the field and in the office, and would be directly responsible for the operations of his field parties and his office force. He would be at all times in direct contact with, or available to, the members of the originating groups during the preliminary development period and the officials of the company during the construction period in order that he might be consulted on any matters pertaining to leases, gas purchase contracts, drilling and collateral activities. He would keep in constant touch with all activities within certain distances of headquarters, recommend the purchase of leases that should be acquired, recommend the locating of drilling sites, assist other departments associated with the geological department, and keep himself so advised as to be able to pass upon matters submitted to him on short notice.

The paleontologist would examine well cuttings and report them, file and record samples, advise as to the progress

of drilling operations, advise as to deeper drilling and new locations, and assist the chief geologist.

The draftsmen would prepare all maps and cross-sections, assist in keeping files, plat well logs, and assist the chief geologist and paleontologist.

The clerks would do all stenographic and clerical work, plat well logs, assist in keeping files, and assist in other [fol. 7898] general office work.

Each of the four field geologists, with an assistant, would be assigned to a specific territory or zone and would be provided with a suitable field office and all necessary equipment with which to carry on the field work.

The zones or territorial divisions would be as follows:

Zone 1. Southern Oklahoma.
Zone 2. Texas Panhandle.
Zone 3. Central West Texas.
Zone 4. All other areas contiguous to the principal markets of Lone Star Gas Company.

The work done by each field party would consist of surface and sub-surface mapping, the scouting of drilling wells, the recommending of desirable leases and drilling sites, the collecting and plotting of well logs, the collecting and studying of samples of formations drilled, the running of well elevations, the making of cross-sections, and the watching of operations of other companies and individuals in reference to leasing.

They would also make special reports and progress reports, and would assist the production department by advice in reference to suitable depths for casing seats and depths of expected production, or water horizons. They would also assist the pipe line department (when in construction) in routing their lines, or the preliminary engineering group (prior to construction) in reference to projecting their lines through the more promising gas areas and areas more favorable for pipe line construction.

They would give tentative estimates as to the probable supply of gas in specific areas, and by so doing, assist the designing engineers in their selection of pipe sizes.

[fol. 7899] All of this work would be done under the direct supervision of the chief geologist who would spend a portion of his time with each of the field parties.

Defendant's Exhibit No. 28—Continued

Costs

Salaries of Personnel

Title	Per Month	Per Year
Chief geologist	$600.00	$7,200.00
Field geologist	400.00	4,800.00
Field geologist	400.00	4,800.00
Field geologist	400.00	4,800.00
Field geologist	400.00	4,800.00
Asst. geologist	200.00	2,400.00
Asst. geologist	200.00	2,400.00
Asst. geologist	200.00	2,400.00
Asst. geologist	200.00	2,400.00
Paleontologist	400.00	4,800.00
Draftsman	175.00	2,100.00
Draftsman	175.00	2,100.00
Clerk	150.00	1,800.00
Clerk	125.00	1,500.00
Total		$48,300.00

Office Rent

Location	Per Month	Per Year
Dallas, Texas	$150.00	$1,800.00
Zone 1	25.00	300.00
Zone 2	25.00	300.00
Zone 3	25.00	300.00
Zone 4	25.00	300.00
Total		$3,000.00

General Office Expense

Item	Per Month	Per Year
Telephone and Telegraph	$50.00	$600.00
Supplies	100.00	1,200.00
Total		$1,800.00

[fol. 7900]

Field Expense

Party	Per Month	Per Year
Chief geologist (average 20 days per month in field at $5.00 per day)	$100.00	$1,200.00
Automobile (2000 miles per month at $.08 per mile)	160.00	1,920.00
Party No. 1 (2 men 30 days in field per month at $4.00 per day)	240.00	2,880.00
Automobile (2000 miles per month at $.08 per mile)	160.00	1,920.00
Party No. 2 (same as No. 1)	240.00	2,880.00
Automobile (same as No. 1)	160.00	1,920.00
Party No. 3 (same as No. 1)	240.00	2,880.00
Automobile (same as No. 1)	160.00	1,920.00
Party No. 4 (same as No. 1)	240.00	2,880.00
Automobile (same as No. 1)	160.00	1,920.00
Total		$22,320.00

Recapitulation

Expense	Amount
Salaries	$48,300.00
Office rent	3,000.00
Office expenses	1,800.00
Field expenses	22,320.00
Annual depreciation on equipment	3,000.00
Total Annual Expense	$78,420.00

The equipment upon which depreciation at the rate of 15% per annum has been charged would consist of office furniture, typewriters, field instruments, microscopes, etc. It is estimated that this equipment would cost in excess of $20,000.00 (see detailed list of geological equipment required under Administration During Construction).

Time Involved:

It was estimated that the preliminary development and organization period would extend over a period of one and [fol. 7901] one half years, and that the detailed geological work would, under the direction of the originating group, begin immediately following the completion of the preliminary geological report which would be completed in six months.

The time of the geological organization attributable to the preliminary development and organization period would be one year and the cost involved $78,420.00.

Geological Investigation for Fiscal Agents:

This investigation would consist in the main of a check upon the geological data in possession of the originating group. It would be made subsequent to the completion of the preliminary geological report, subsequent to the completion of some of the work done by the geological organization of the originating group, and subsequent to the actual drilling of wells upon acquired acreage.

For these reasons the personnel required for this investigation and check would be comparatively small and the time required for its completion would not exceed sixty days.

This work would be done by a firm of geologists whose standing would be such as to make their report of value in connection with prospectuses that would be used in marketing the security issues.

It is estimated that the cost of this report would be not less than $15,000.00.

Engineering Investigation for Fiscal Agents:

This investigation would consist of a check upon all market data, the general design of the system, the estimates of [fol. 7902] cost, and the estimate of earnings covered by the engineering data secured by the originating group.

As in the case of the geological check prepared for the fiscal agents, this engineering report would be made by a firm of engineers whose findings would have weight in connection with the issuance of securities. The personnel required for its preparation would be much smaller than the personnel required for the original investigation, and the necessary field and office work would be completed within sixty days.

It is estimated that the cost of this report would be not less than $15,000.00.

The apparent duplication of work and expense in connection with these two reports prepared by firms selected by the fiscal agents could not be avoided in the reproduction of Lone Star Gas Company. Any group of fiscal agents engaged in the underwriting of more than fifty million dollars worth of securities for the construction of a natural gas project, would require these reports notwithstanding the nature of the information previously secured by the originating group.

Legal Investigation for Fiscal Agents:

It has been assumed that one of the basic requirements for underwriting would be the acquisition and partial development, on the part of the originating group, of a substantial part of the acreage now owned in fee or held under lease by Lone Star Gas Company. In connection with permanent financing, the validity of the titles of land owned in fee, or held under lease, as well as the titles in connection with gas purchase contracts would be a matter of pri- [fol. 7903] mary importance. The fiscal agents would require a certification of all titles by a firm of attorneys whose opinion would have weight in connection with the marketing of the securities. The originating group would furnish this firm with title opinions prepared by their own attorneys, together with a copy of all abstracts. An examination of more than five hundred abstracts would be involved in this investigation, and the cost to the originating group for the certification would be not less than $25,000.00.

Cost of Gas Lands, Gas Leases, Rights, and/or Options:

The value of the gas lands, gas leases, rights and/or options held by Lone Star Gas Company as of January 1,

1933, has been independently determined and included in the appraisal as a part of the physical property of Lone Star Gas Company as of that date. For this reason, any part of the value ascribed to these items cannot be included as a part of the development costs.

The necessity for the consideration of the appraised value of a part of these items in connection with the development period grows out of the fact that the date at which these expenditures would be made, from the standpoint of the corporation, would have a direct bearing upon the cost of Interest During Construction.

In view of the assumption that all gas lands, gas leases, rights, and/or options acquired by the originating group and transferred to the corporation when organized, would be transferred upon the basis of their fair market value (appraised value), the Estimated Cost of these property items becomes immaterial in connection with any money outlay on the part of the corporation.

[fol. 7904] The necessity for the consideration of the estimated cost of a part of these items in connection with the development period grows out of the fact that these costs would be a part of the out-of-pocket expenditures of the originating group, and as such, would have a direct bearing upon the amount of remuneration to which the originating group would be entitled.

It is estimated that the fiscal agents would require the originating group to acquire at least fifty per cent of the gas lands, gas leases, rights, and/or options held by Lone Star Gas Company as of January 1, 1933, before tentative commitments for permanent financing would be made. This requirement would cover, in proportionate amounts, the acreage classified as developed acreage and undeveloped acreage.

The value included in this appraisal for the gas lands, gas leases, rights, and/or options, developed and undeveloped, has been estimated at $3,574,980.

At the date of incorporation, the originating group would transfer to the corporation one-half of these assets, and the corporation would reimburse the originating group with the proceeds from the sale of bonds representing one-half of the total value for gas lands, gas leases, rights, and/or options included in this appraisal, or $1,787,490.

The cost to the originating group of the assets thus transferred would consist of the following items:

1. The original cost of the gas lands, leases, rights, and/or options actually transferred.

2. The cost of acquisition, including the expenses of a land and lease organization.

3. The cost of cancelled and surrendered leases, or leases eliminated by the fiscal agents.

[fol. 7905] 4. The cost of rentals accrued prior to transfer.

5. The cost of dry holes drilled in connection with the testing of acreage.

6. The cost of general supervision of drilling operations.

(1) The original cost of the gas lands, leases, rights, and/or options:

As developed in the subsequent analysis of the remuneration for the originating group, the actual acreage originally acquired by the originating group would be largely in excess of the acreage approved by the fiscal agents and transferred to the corporation at its fair market value, or appraised value.

This acreage would have been secured by the originating group largely upon the basis of geological investigations, inasmuch as the drilling explorations of Lone Star Gas Company, and the drilling explorations that have resulted from the existence of Lone Star Gas Company as a marketing agency were assumed to have been non-existent at the date of the initiation of the project. This assumption is a logical application of the theory of reproduction as applied to this property.

Acreage acquired under these circumstances would normally suffer heavy charge offs for cancellation, surrenders, and eliminations by the fiscal agents before this acreage could be comparable to the character of acreage now held by Lone Star Gas Company and assumed to have been transferred to the corporation by the originating group. In [fol. 7906] view of these circumstances it is estimated that the originating group would acquire as a minimum twice the amount of gas lands, gas leases, rights, and/or options actually transferred.

(2) The cost of acquisition:

The cost of acquisition would be represented by the salaries and expenses of a land and lease organization that would begin to function immediately upon decision of the originating group to begin the acquisition of acreage. This organization would:

(a) In conjunction with the Geological Department make thorough investigations of possibilities of all acreage, both producing and non-producing, within general areas prescribed by the originating group, and then determine from time to time the particular portion or portions of each general area in which non-developed acreage and producing properties were to be acquired.

(b) Likewise in conjunction with the Geological Department, keep in close touch with all drilling and producing wells in the general areas, by whomsoever drilled or operated.

(c) Prepare, or have prepared, and put in general use certain standard forms, such as scout reports, purchase orders, purchase drafts, options, escrow agreements, executory contracts, division orders, transfer orders, gas purchase contracts, oil and gas leases, moneral deeds, and general office records.

(d) Negotiate and finally consummate, through brokers and with owners, the acquisition of developed and undeveloped acreage within the areas aforesaid.

(e) Examine and approve, or have examined and ap- [fol. 7907] proved, all abstracts and other title papers in connection with each transaction.

(f) Install a complete and elaborate system of office records for entering up and keeping track of all leases and other properties acquired.

(g) Record all instruments necessary to be recorded and pay all fees therefor.

(h) Pay all delay rentals, royalties and other fixed sums due under the terms of instruments so acquired.

(i) From time to time, enter into contracts with other owners for joint test wells on blocks of acreage held partly by such other owners.

(j) Determine location of test wells on acreage wholly or partly owned and to handle all details in connection therewith.

(k) Determine from time to time which leases are to be continued by payment of delay rentals and which are to be allowed to lapse for non-payment.

(l) Have all releases executed and delivered to land owners.

(m) Conduct all correspondence and negotiations having to do with the properties generally, other than problems relating to accounting, operating and the like.

This organization would function throughout the Development and Organization period and would continue to [fol. 7908] function as part of the administrative and legal organization throughout the pre-construction and construction periods.

(3) The cost of cancelled and surrendered leases, or leases eliminated by the fiscal agents:

Upon the assumption that the originating group would acquire during the development period twice the amount of acreage finally accepted by the fiscal agents, the cost of cancellations, surrenders, and eliminations, would result in an over all cost to the originating group of an amount equal to the original cost of the acreage actually transferred.

(4) The cost of rentals accrued prior to transfer:

The cost of rentals accrued during the development period would be comparatively small due to the short time included in the development period taken in connection with the fact that leases would not be acquired until some definite information had been secured from the results of the preliminary geological survey.

Such rentals as would accrue upon leases secured during the early months of the development period would contribute to the cost of such leases.

(5) The cost of dry holes drilled:

The ratio of dry holes to total wells drilled during the development period would necessarily be largely in excess

of the actual experience of Lone Star Gas Company within [fol. 7909] the past years. Practically all drilling done during this period would be based upon the geological data furnished by the preliminary report, and the subsequent investigations of the originating groups own geologists. The drilling in the areas as proved would be reduced to the minimum, and the exploration program extended to other areas in order to prove the unexplored territory under lease.

Each of these factors would contribute to an increase over the normal dry hole ratio. It is estimated under these conditions that conform to those under which the drilling would actually take place in the reproduction of Lone Star Gas Company, that the percentage of producing wells would not exceed fifty per cent of the total wells drilled.

As of January 1, 1933, Lone Star Gas Company owned 270 producing gas wells located as follows:

Texas

Field	No. Wells
Cheaney	18
Leeray	45
Sipe Springs	8
Miscellaneous	12
Panhandle	78
Petrolia	49
Total Texas	210

[fol. 7910] Oklahoma

Field	No. Wells
Chickasha	43
Duncan	9
Fox	8
Total Oklahoma	60
Total Oklahoma and Texas	270

In connection with the transfer by the originating group to the corporation of one-half of the gas lands, gas leases, rights, and/or options owned by Lone Star Gas Company as of January 1, 1933, it has been assumed that the ratio between developed and undeveloped acreage existing at this date would apply to the acreage transferred.

It would not be reasonable to assume that the drilling of one-half the total number of wells owned by Lone Star Gas Company as of January 1, 1933, would be required to establish this ratio of developed and undeveloped acreage. For this reason, the following estimate has been made of the minimum number of wells, by fields, that would be required to establish this ratio.

Texas

Field	No. Wells
Brad	2
Cheaney	5
Desdemona	1
X-Ray	1
Frankell	1
Leeray	15
Moran	1
Petrolia	1
Ranger	1
Shamrock	20
Sipe Springs	3
[fol. 7911]	
Tiffin	1
Total Texas	52

Oklahoma

Field	No. Wells
Chickasha	6
Duncan	2
Loco	3
Walters	1
Total Oklahoma	12
Total Oklahoma and Texas	64

In the above estimate and allocation of wells, consideration has been given to the amount of developed and undeveloped acreage held by Lone Star Gas Company in each of the fields as of January 1, 1933.

This estimate of the number of producing gas wells developed through the explorations of the originating group fixes the number of dry holes that would result from fifty per cent ratio at 64.

The minimum average direct cost of these unsuccessful tests would not be less than $20,000.00 per well, or a total estimated expenditure of $1,280,000.00 on the part of the originating group that would be absorbed in the appraised value of the leaseholds actually transferred.

(6) Cost of general supervision of drilling operations:

If all wells drilled by the originating group were drilled under contract which would be the logical method of procedure, it would be necessary for them to maintain an organization for the proper supervision of the field operations.

[fol. 7912] This organization would consist of a superintendent of production and office assistants together with district foremen with headquarters in the several fields.

The superintendent of production would be responsible for:

(a) The letting of drilling contracts.
(b) The general supervision of all drilling operations.
(c) The setting of pipe.
(d) The finishing of wells.
(e) The ordering of all material.
(f) The arranging for water and fuel.
(g) The letting of contracts for the construction of rigs and hauling of material.
(h) The continuing or abondening of drilling (in connection with the geological department).

The expenses of this department during the development period insofar as this cost would be properly allocated to dry hole expense would be a part of the cost of the acreage transferred by the originating group.

In the foregoing analysis, no attempt has been made to estimate the cost of the several items that would determine the expense of the originating group in connection with gas lands, gas leases, rights, and/or options transferred to the corporation.

It is evident that this cost would approximate the appraised value of the same items that has been used as the basis for the corporate expenses incurred in the transfer. The dry hole expense alone has been conservatively estimated at more than a million dollars. The cost of cancelled, surrendered, and eliminated leases together with the cost

of lands, leases, rights, and/or options acceptable to the fiscal agents, would be substantially in excess of this amount [fol. 7913] with no consideration given to other items of expense.

Throughout this analysis of Preliminary and Development Expenses, each step has been based upon a logical sequence of the necessary steps that would be involved in the promotion, and a conservative estimate has been made of the costs that would be incurred in each of these steps insofar as these costs have been made a part of the reproduction cost estimate.

The estimated cost to the originating group of the gas lands, gas leases, rights, and/or options transferred to the corporation has not been made a part of the reproduction cost of Lone Star Gas Company as of January 1, 1933. Furthermore, certain inconsistencies would arise in connection with any determination of the cost of these items as distinguished from their value. For example: the original cost of the lands held in fee in the Petrolia field was based upon the existence of reserves that had been greatly depleted at the date of this appraisal. In fact, all developed leaseholds included in the transfer have been evaluated upon the basis of a certain percentage of withdrawals of gas that would be inconsistent with the assumption of the non-existence of Lone Star Gas Company at the initiation of the project.

For these reasons, it has been assumed that the cost to the originating group of the acreage transferred at the date of incorporation would be equal to the appraised value at which this acreage has been included in the appraisal, and the foregoing analysis of the constituent elements of this cost has been made for the purpose of showing that this assumption could not be substantially in error.

[fol. 7914] Cost of Producing Gas Wells:

It has been estimated that at least sixty-four producing gas wells would be required to prove the producing acreage held by Lone Star Gas Company as of January 1, 1933.

The estimated direct cost of completing these wells as developed by this appraisal as well as the location of the wells by fields is shown in the following tabulation:

Texas

Field	Cost per Well	Number of Wells	Total
Brad	$19,292.00	2	$38,589.00
Cheaney	19,878.00	5	99,390.00
Desdemona	19,292.00	1	19,292.00
X-Ray	19,292.00	1	19,292.00
Frankell	19,292.00	1	19,292.00
Leeray	25,382.00	15	380,730.00
Moran	19,292.00	1	19,292.00
Petrolia	9,226.00	1	9,226.00
Ranger	19,292.00	1	19,292.00
Shamrock	12,336.00	20	246,720.00
Sipe Springs	18,313.00	3	54,939.00
Tiffin	19,292.00	1	19,292.00
Total			$945,341.00

Oklahoma

Field	Cost per Well	Number of Wells	Total
Chickasha	$13,416.00	6	$80,496.00
Duncan	11,151.00	2	22,302.00
Loco	6,755.00	3	20,265.00
Walters	11,151.00	1	11,151.00
Total			$134,214.00
Total Texas and Oklahoma			$1,079,555.00

The general production expenses attributable to these direct charges is estimated at 3.7 per cent of $1,079,555.00, or $39,944.00.

[fol. 7915] Organization and Corporate Costs:

Following the agreement between the fiscal agents and the originating group with reference to the financial structure of the corporation, the actual creation of the corporate entity would begin.

1. Preparation of charter, by-laws, and contract for financing:

The preparation of the corporate charter and by-laws and the execution of the contract for financing would be the

first steps in the organization program. This work would be done jointly by the attorneys of the originating group and the fiscal agents.

The attorneys representing the fiscal agents would be members of a firm favorably identified in financial circles, with work of this character. The fees for their services in this connection and the subsequent phases of the corporate organization and the financial set up would be not less than $30,000.00.

The attorneys for the originating group would be their regularly retained counselors, their opinions would not be used in connection with the marketing of the securities, and the fees for these services in this connection and the subsequent phases of the corporate organization and financial set up would not be less than $15,000.00.

2. Charter and Qualification fees:

The charter fees in the State of Texas for corporations having an authorized capital stock in excess of $2,640,000.00 is $2,500.00. In the State of Oklahoma the qualification fee [fol. 7916] is $1.00 per $1,000.00 of capital expended in the State (estimated for Lone Star Gas Company as of December 31, 1931, to be approximately $7,500,000.00) which would result in a fee of $7,500.00, or a total of $10,000.00 for charter and qualification fees.

3. Execution of mortgage and issuance of securities:

The attorneys for the originating group and the fiscal agents would jointly prepare the mortgage and trust indenture. The cost of their services with reference to this and other phases of corporate organization has been provided for in the allowances previously made.

Certain definite out-of-pocket expenditures would be necessary in connection with the subsequent steps.

An estimate of the total expenditures would be made for the purpose of developing the subsequent calculations. This estimate has been assumed to be as follows:

Cost of physical property and general costs	$64,000,000.00
Working capital and supplies	2,000,000.00
Requirements for fixed charges during the development period	2,000,000.00
Total estimated requirements	$68,000,000.00

The capital structure assumed, 50% of the total requirements in bonds, 25% in preferred stock, and 25% in common stock would require the following issues:

	Cash Received	Price	Securities Issued
Bonds	$34,000,000.00	$90.00	$37,778,000.00
Preferred Stock	17,000,000.00	90.00	18,889,000.00
Common Stock	17,000,000.00	100.00	17,000,000.00
	$68,000,000.00		$73,667,000.00

[fol. 7917] For the purpose of this estimate the bonds have been placed at $38,000,000.00, the preferred stock at $19,000,000.00, and the common shares at $17,000,000.00 par basis, or a total issue of $74,000,000.00.

Upon this basis, the following expenses would be incurred:

(a) Federal capital stock issue tax:	
$36,000,000.00 total par value at $.05 per $100.00	$18,000.00
(b) Engraving stock certificates at $.08 each:	
Certificates of preferred stock	$608.00
Certificates of Common Stock	136.00
Total	$744.00
(c) Listing securities on the Pittsburgh Stock Exchange:	
First $500,000.00 of capitalization	$200.00
Next $500,000.00 of capitalization	100.00
Next $24,000,000.00 of capitalization at $50.00 per each $1,000,000.00	1,200.00
Next $49,000,000.00 of capitalization at $25.00 per each $1,000,000.00	1,225.00
Total	$2,725.00
(d) Printing mortgage:	
Printing mortgage	$500.00
(e) Recording mortgage in:	
62 counties in Texas and 14 counties in Oklahoma	$3,800.00

(f) Engraving bonds at $.50 per bond:

$1,000.00 bonds—(34,000.00 each)	$17,000.00
500.00 bonds—(8,000.00 each)	4,000.00
Total	$21,000.00

[fol. 7918] (g) Federal tax on bonds at $.05 for each $100.00:

$38,000.00 00 par value	$19,000.00

(h) Trustee's fees and legal fees in connection with certifying, signing, and sealing 42,000 00 bonds at $.50 each $20,000.00

Recapitulation

Item	Amount
1. Attorney's fees fiscal agents	$30,000.00
2. Attorney's fees originating group	15,000.00
3. Charter and Qualification fees:	
(a) State of Texas	2,500.00
(b) State of Oklahoma	7,500.00
4. Execution of mortgage and issuance of securities (attorney's fees included in items 1, and 2):	
(a) Federal capital stock tax	18,000.00
(b) Engraving stock certificates	744.00
(c) Listing securities	2,725.00
(d) Printing mortgage	500.00
(e) Recording mortgage	3,800.00
(f) Engraving bonds	21,000.00
(g) Federal tax on bonds	19,000.00
(h) Trustee's fees	21,000.00
Total organization and corporate costs	$141,769.00

The foregoing estimate has been made upon security issues which would be estimated to amply cover all expenditures in connection with the construction of the property, the preliminary expenses incurred prior to construction, the undistributed general charges including Interest During Construction, the purchase of the necessary stock of materials and supplies required for operation, the initial working capital, discounts on the securities issued, and an esti-

mated amount with which to meet the excess cost over operating revenues of fixed charges and operating expenses during the period of business development.

Nothing has been included in the foregoing estimate for [fol. 7919] Financial Costs other than the out-of-pocket expenditures that would be made in connection with the fiscal agent's investigation of the project, the preparation and filing of the mortgage, the printing and listing of securities, and such capital stock and bond taxes as would be imposed by governmental authority.

In addition to the foregoing costs, the corporate organization created for the purpose of reproducing the property and business of Lone Star Gas Company would incur substantial expenses in marketing the securities issued, and would also absorb the monetary loss represented by the difference between the par-value of the securities issued and the price paid for the securities by the ultimate purchasers. There could be no escape from the incurrence of these costs in the reproduction of Lone Star Gas Company as of January 1, 1933, nor could any other enterprise of like magnitude have been financed at that time without the incurrence of these charges in substantial amounts.

It is obvious that if the cost of financing as represented by brokerage charges or the equivalent expenses of marketing the securities of the corporation would be an inescapable out-of-pocket expense in the reproduction of the property and business of the company at the appraisal date, then any appraisal reflecting the true reproduction cost of the property and business of Lone Star Gas Company as of January 1, 1933, must include a proper allowance to cover these charges.

It is also obvious that if the securities issued would of necessity be placed in the hands of the investing public at a price less than the par-value of these securities, some provision must be made to compensate the issuing corporation [fol. 7920] for the added interest above the coupon rate that such discounts would impose.

Brokerage or Marketing Costs:

Of the two elements of financial costs herein discussed, brokerage or an equivalent marketing cost is the more definite. It would be incurred as an out-of-pocket expenditure without reference to current market conditions, the credit

of the issuing corporation, or the coupon rates of the securities issued. For this reason, brokerage as distinguished from discount, is a proper element in a rate-base determined by the cost of reproduction.

No large issue of securities has ever been placed in the hands of the investing public without the incurrence of marketing costs on the part of the issuing party. The security issues of the United States Government afford no exception to this general rule, and these expenses would be incurred whether the issuing company marketed its securities through its own organization, or utilized the facilities and organization of an investment banker.

Historical consideration must give way to present conditions in reproduction cost estimates. This fact is evidenced by the use of present prices for materials of construction and present rates for labor in all reproduction cost estimates. Another example of this basic fact is found in a situation wherein a substantial part of a property may have been built before the perfection and general adoption of certain labor saving devices that would be applicable to the particular classes of construction involved. Any engineer in the preparation of a reproduction cost estimate of this property would formulate his cost data upon the basis of the normal methods of construction in general use at the appraisal date, and would give no consideration to the fact [fol. 7921] that a substantial part of the property had been constructed by obsolete and more costly methods.

It follows as a corollary of this basic proposition that the financial structure of Lone Star Gas Company, which for a public utility is unique, and which has been the result of more than twenty years of cumulative development, can have no proper bearing upon the cost of reproduction insofar as the financial structure is involved at the appraisal date. In reproduction, Lone Star Gas Company could not be financed as it has been financed historically, and the problem resolves itself into the determination of the financial structure which would be the normal one at the date of inquiry, and which would result in the securing of funds necessary for construction and business development at a minimum cost, brokerage discounts and coupon rates considered.

In the final analysis, reproduction cost is simply a measure of value, and whenever there is a divergence between cost and value, or whenever the situation is such that cost does not contribute to value, value alone must be considered.

In the instant case wherein brokerage, or the marketing costs of security issues is involved, there is no divergence between cost and value. Lone Star Gas Company is financed and is a going concern. The money required for the construction of its property, and the development of its business has been assembled and transformed into units of property and business whose cost of duplication can be fairly measured in terms of dollars. It follows as an inevitable conclusion that if under any assumed conditions, it would cost money to assemble the dollars required to duplicate this property and business, then this property soundly [fol. 7922] financed is worth more than the aggregate sum represented by the dollar measure of its integral parts. The present value of this increment in worth cannot be less than the cost of assembling the dollars required by a normal financial structure. This conclusion may be clarified by the statement that the collection of a large sum of money so that it is available for the purchase of the materials of construction, and for the payment of services required for the initiation of a business enterprise, has a peculiar and intrinsic worth to the enterprise for which it is available over and above a like sum of money not thus assembled and available for use. The measure of this worth or value is the normal cost of assembly.

The Interstate Commerce Commission in its classification of investment in road and equipment of steam roads, clearly recognizes the propriety of the inclusion of the cost of assembling capital as a capital item. In its definition of Organization Expenses the following statement is found: "This account shall include * * * cost of preparing and distributing prospectuses; cost of soliciting subscriptions for stock; cash fees paid to promoters, and the actual cash value (at the time of the organization) of securities paid to promoters".

Discount:

As indicated by the quotations on all natural gas utilities securities current as of January 1, 1933, no securities, either senior or junior, issued for the purpose of securing funds for the construction of a natural gas producing and transporting system, could have been disposed of except at a substantial discount below the par value of the security

issue. This condition has become more marked since the appraisal date and applies to the security issues of all [fol. 7923] natural gas utilities without regard to their records for continuous service, and without regard to their record of earnings.

No hypothesis can be proposed with reference to a financial structure, or to the obvious desirability of the project, that can escape the general proposition that both senior and junior securities of a natural gas producing and transporting company would of necessity be disposed of at substantial discounts below par-value.

Discounts on security issues, however, unlike the direct costs of assembling capital, do not represent out-of-pocket expenditures. Furthermore, discount to a greater degree than marketing costs reflects the credit rating of the organizers of the issuing companies, and the coupon rates of the securities issued. In the final analysis, discount is simply an increment above coupon rates of interest, and as such, reflects the cost of money as measured by interest charges. For these reasons, discount on security issues is not a proper element in a rate-base and it is, therefore, omitted in this appraisal as an element of the reproduction cost of Lone Star Gas Company as of January 1, 1933.

On the other hand the current discounts on securities, similar in all respects to the securities that would be issued in the reproduction of Lone Star Gas Company should be one of the dominant factors in the determination of what constitutes a fair rate of return for a natural gas pipe line company.

Calculation of Financial Costs, or the Costs of Assembling Capital:

In this estimate of Preliminary Development and Organization Costs, certain basic assumptions have been made with reference to the capital structure of the company, and the obligations assumed by the originating group that must be [fol. 7924] considered in connection with the estimate of financial costs.

(I.) It was assumed that the originating group would be responsible for securing the funds represented by subscriptions for common shares, and that all costs in connection therewith would be included in the amount allowed the originating group as compensation for their promotional

services. This method of handling the disposition of the common shares of the company would relieve the corporation of the marketing expense of twenty five per cent of its capital issue.

(II.) For the remaining seventy five per cent of the capital issue, it has been assumed that twenty five per cent of the total money required would be secured through the sale of eight per cent preferred stock, and fifty per cent through the sale of six and one-half per cent first mortgage bonds. As previously stated, this assumption does not conform to the financial structure of Lone Star Gas Company, but creates a situation with reference to the cost of marketing securities that would result in substantially lower costs than if the existing financial structure had been used as the basis for estimate. The cost of assembling capital by means of the sale of preferred stock, and first mortgage bonds, particularly in the market of January 1, 1933, would have been substantially less than the cost of assembling a like sum of money through the sale of common shares.

Throughout the preparation of this estimate, the actual experience of Lone Star Gas Company has been used provided this experience had a logical application to the problem under consideration. Lone Star Gas Company has issued and sold neither preferred stock, nor mortgage [fol. 7925] bonds. Lone Star Gas Corporation, however, whose principal asset is the ownership of the common shares of Lone Star Gas Company, has disposed of both classes of securities, but in a much lower ratio to total assets than the ratio used in the hypothetical financial structure. Furthermore, at the time these securities were placed in the hands of the investing public, the corporation was a going concern with a record of successful operation and normal earnings. For these reasons, the use of the actual cost to Lone Star Gas Corporation for the assembling of capital by the issuance of preferred stock and bonds as the basis of the estimate of similar charges in the reproduction of Lone Star Gas Company as of January 1, 1933, is more conservative from the standpoint of costs than a strict interpretation of the rules governing reproduction cost estimates would justify.

In May, 1927, Lone Star Gas Corporation issued $15,000,000 of five per cent debentures. The initial sale of this issue was made at $98.75 per $100 unit of the issue. The

marketing cost to Lone Star Gas Corporation, exclusive of all incidental charges and expenses, was $3.00 per $100 unit of the issue.

It has been previously estimated that an equivalent of 380,000 first mortgage bonds of $100 par value each would constitute the underlying or senior issue in connection with the best financial structure that could be suggested for securing the funds necessary for the reproduction of Lone Star Gas Company as of January 1, 1933. It is certain that this issue could not have been placed in the hands of the investing public as of that date for a unit cost as low as $3.00 per $100 unit of issue. For the purpose of this estimate, however, this conservative figure has been used with reference to the marketing costs of first mortgage bonds.

[fol. 7926] In October, 1929, Lone Star Gas Corporation issued $8,000,000 of 6.5 per cent preferred stock. The initial sale of this issue was made at par, and the marketing cost to Lone Star Gas Corporation, exclusive of all incidental charges and expenses, was $4.50 per $100 unit of the issue.

What has been said with reference to the cost of marketing first mortgage bonds applies with greater force to the cost of marketing junior securities. Conditions were much more favorable for the disposition of junior issues in 1929 than the conditions prevailing as of January 1, 1933. Furthermore, as previously stated in the case of both issues of Lone Star Gas Corporation, the issues themselves represented a relatively small part of the total capital structure, and the issuing company was a going concern with a long operating history, and a record of satisfactory earnings. For these and other reasons, the adoption of $4.50 per $100 unit as the estimated marketing cost of 190,000 $100 units of preferred stock in the reproduction of Lone Star Gas Company as of January 1, 1933, is extremely conservative, and the figure adopted is substantially less than the marketing costs that would have been incurred as of that date.

Cost of Marketing First Mortgage Bonds:	
380,000 $100 units at $3.00 each	$1,140,000
Cost of Marketing Preferred Stock:	
190,000 $100 units at $4.50 each	855,000
Total Marketing Costs	$1,995,000

[fol. 7927] Remuneration for the Originating Group:

As previously noted the remuneration for the originating group would be measured by several factors.

1. The type of personnel that would be required for the successful promotion of an enterprise identical with Lone Star Gas Company as of January 1, 1933.

2. The time that would be required to bring the project from its initial stage to the completion of corporate organization.

3. The total cost and extent of the project.

4. The risks involved in the promotion.

5. The amount of the out-of-pocket advances made by the originating group during the development and organization period.

6. The value of the services of the originating group in

(a) Negotiating for, or closing gas sales contracts.

(b) Negotiations with the promoters of distribution properties for the construction of natural gas distributing systems in the market area served by the pipe line company.

(c) Negotiating with the fiscal agents for the permanent financing of the corporation.

(d) Setting up the financial structure of the corporation.

(e) Organizing the corporation and placing it in readiness to do business.

7. The extent of the participation of the originating group in the permanent financing of the corporation.

8. The expenses of the originating group included in their remuneration.

9. The fees normally expected and received for services of a similar nature.

In the preparation of the estimate no consideration has been given to the abnormal conditions existing at this time with reference to the promotion of enterprises and the marketing of securities.

[fol. 7928] Type of Personnel That Would be Required:

It has been previously stated that the personnel that would be required to initiate and bring to a successful conclusion the promotion of a natural gas enterprise identical with Lone Star Gas Company would consist of a group of not less than four men of exceptional ability with substantial financial connections, and wide experience in the natural gas business.

This assumption assures a minimum expense in connection with development charges.

This is true for the reasons that if the individuals of the originating group did not have these characteristics, the preliminary period would be of much longer duration than the one and one half years assumed in this estimate, fiscal agents would be less ready to assume underwriting responsibilities, and delays would be incurred in negotiations with them, the probabilities of increased costs through errors of judgement would be substantially increased, difficulties would be encountered in securing cooperation from other corporations, or individuals with reference to the construction of the necessary distribution plants in the various cities and towns proposed to be served, and the cost of marketing securities and the spread between the price received by the corporation and their par value would be increased.

Men having the qualifications of this originating group, and assuming the responsibilities and risks that the promotion of Lone Star Gas Company would involve, could not be attracted to the promotion unless its successful conclusion carried with it the assurance of substantial financial [fol. 7929] remuneration for their services. This remuneration would be greatly in excess of any consideration based upon salaries however large.

Time Involved:

The preliminary development and organization period has been estimated as one and one half years.

In view of the magnitude of the project and the amount of detail work that would be required in connection with the field work, the acquisition of leases, the drilling of wells, the negotiations with bankers, the negotiations with owners of distribution plants, prospective builders of distribution plants and prospective large industrial customers and the

work in connection with corporate organization, the entire time of each member of the originating group would be absorbed throughout the period.

Total Cost and Extent of the Project:

The total remuneration for the originators of any project is a function of the total cost and the complexity of the project. The amount of money required for the reproduction of Lone Star Gas Company as of January 1, 1933, would not be less than sixty five million dollars without consideration of the fixed charges during the period of business development.

The preliminary development stages of a large natural gas producing and marketing system would be more complex and would require of the originators more intensive application than would the preliminary stages of any other public utility involving a like expenditure of money.

Each of these factors has been taken into consideration in fixing the fee for the originating group.

[fol. 7930] Risks Involved in the Promotion:

The percentage of ventures that fail in the development period is relatively large. Other ventures that are finally launched have a background of failure on the part of one or more promotional groups. The possibility of loss on the part of any originating group is an inherent characteristic of any business promotion. This fact applies with particular force to the promotion of an enterprise that is based upon the successful outcome of the most hazardous of all mining ventures.

The fact that Lone Star Gas Company is in successful operation as of the date of this appraisal would not eliminate this element of risk in reproduction.

It has been assumed as one of the basic factors of this estimate that the originating group would transfer to the corporation at their fair market value (as of January 1, 1933) a substantial part of the lands, leases, gas purchase contracts, and producing gas wells now owned by Lone Star Gas Company.

The gas reserves of Lone Star Gas Company represented by lands held in fee or leases, and gas rights as of January 1, 1933, are the result of twenty years experience and exploration in the territory and a culling of unproductive or

unpromising acreage. From 1918 to 1933, inclusive, $2,471,593.76 has been written off the books of Lone Star Gas Company for cancelled and surrendered leases.

In order that the acreage transferred to the corporation by the originating group might prove acceptable to underwriters as evidence of a supply adequate to justify the [fol. 7931] financing of the project, the originating group would acquire and test acreage largely in excess of the amount actually transferred. During this period of exploration and testing, the dry hole ratio, despite the geological information derived from the investigations previously set out, would be abnormally high as would be the concurrent expense for cancelled and surrendered leases. The wells drilled during this initial stage of the development would necessarily be located in semi-wildcat territory, and the leases secured would not have been selected upon the basis of information secured through exploration.

It is certain that the fiscal agents would scrutinize with extreme care the value of the leaseholds transferred to the corporation and would require that all wells be producers of gas and be in good condition.

The originating group could have no assurance at the initiation of the project that their out-of-pocket expenditures for lands in fee, leaseholds, gas rights, and exploration and testing would be reimbursed by the sum represented by the fair market value of the lands in fee, leaseholds, and gas rights acceptable to the fiscal agents, and the reproduction cost of the producing gas wells.

The Out-of-Pocket Advances of the Originating Group:

The originating group would advance all money required for:

1. The preliminary geological survey.
2. The preliminary engineering survey.
3. The detailed geological work.
4. The purchase of all lands held in fee, all leaseholds and options together with the cost of their acquisition.
5. The drilling of wells together with the supervisory expenses in connection therewith.

[fol. 7932] 6. The fiscal agent's geological report.

7. The fiscal agent's engineering report.
8. The fiscal agent's legal report on titles and contracts.

9. The organization of the corporation.

10. Their office expenses, traveling expenses, the salaries of all clerks, stenographers and technical advisors other than those specifically covered in the foregoing items.

It has been assumed in connection with the foregoing items that the originating group would be reimbursed by proceeds of the sale of bonds of the corporation for the actual expenses incurred for items 1, 2, 3, 6, 7, 8 and 9; that for item 4, the reimbursement would be made upon the basis of the fair market value of the lands, leases and options, and that for item 5, the transfer would be made upon the basis of the reproduction cost of the wells.

All expenses in connection with item 10 would be absorbed by the promotion fee, which would also be paid from the proceeds of the sale of bonds.

The following summary sets out the estimated cost of these items.

1. Preliminary geological survey	$114,444.00
2. Preliminary engineering survey	49,695.00
3. Detailed geological work (one year)	78,420.00
4. Cost of lands, leases and options	1,721,618.00
5. Cost of drilling wells	1,119,499.00
6. Fiscal agent's geological report	15,000.00
7. Fiscal agent's engineering report	15,000.00
8. Fiscal agent's legal report	25,000.00
9. Organization expenses	141,769.00
Total	$3,280,445.00

Items 10 and 11 are omitted for the reason that they will be considered independently with reference to expenses included in the promotion fee.

[fol. 7933] Value of the Services of the Originating Group in Connection With the Following Items:

(a) Negotiating for, or closing gas sales contracts:

Before final commitments could be secured for permanent financing, the fiscal agents would require of the originating group some definite assurance of a market for the sale of gas. Negotiations would be conducted with the major industrials in the market area, and as has been assumed in the analysis of the cost of business development (see Going

Value) a certain proportion of the ultimate industrial consumers now served by Lone Star Gas Company would be attached immediately upon the completion of the lines to the market centers.

The acquisition of this business would be of value not only as an aid in the financing of the company, but also as a factor in the reduction of the cost of subsequent business development.

(b) Negotiating with the owners of distributing properties and the prospective builders of distributing plants:

Lone Star Gas Company as of January 1, 1933 served approximately 270 individual cities and towns as a wholesaler of natural gas for local distribution to approximately 240,000 individual domestic consumers.

Under the basic assumption that Lone Star Gas Company would be non-existent at the initiation of the project, not more than ten cities in this group would have artificial distributing plants, and these plants measured by the present customer saturation, would be sub-normally de- [fol. 7934] veloped as natural gas markets.

The cost of constructing the physical plant of Lone Star Gas Company as of January 1, 1933 could not be underwritten unless assurance could be given that the larger markets having artificial plants would be converted and extended, and that distribution plants would be constructed in the smaller cities and towns where no plants existed at the time of the promotion.

In the subsequent calculations of the cost of Interest During Construction (see Interest During Construction), it has been assumed that the actual construction of the physical property of Lone Star Gas Company could be completed within a three year period. In the subsequent calculation of the cost of Business Development (see cost of Business Development), it has been assumed that concurrent with the construction of the physical property of Lone Star Gas Company there would be an extension of mains in the cities having artificial gas service and a construction of plants in the smaller cities in order that service could be begun promptly upon the completion of the pipe line system. These assumptions materially reduce the total reproduction cost estimate of the property in that the highly important items of the cost of Interest During Construction,

and the cost of Business Development are proportionately reduced.

The period of construction and the situation in reference to the ready availability of the domestic market as- [fol. 7935] sumed in this estimate could be predicated only upon the primary assumption that the originating group had successfully concluded preliminary negotiations for the extension of existing plants and the construction of new plants during the development period.

The value of this service when measured by its effect upon the marketability of securities, the reduction of Interest During Construction, and the reduction of the period of business development, would be greater than the total amount set out as the promoters' remuneration.

(c) Negotiating with the fiscal agents:

The originating group would conduct and conclude all negotiations with the fiscal agents for permanent financing. In view of the magnitude of the project, these negotiations would extend over a considerable period of time, would require of the originators the exercise of judgment and skill, and would involve numerous group conferences in the financial centers with attendant expenses.

(d) Setting up the financial structure:

The originating group would be jointly responsible with the fiscal agents for the financial structure determined upon. The financial standing of the group, together with their background of experience, would permit the use of a structure favorable to the corporation and the one assumed as a basis for this estimate.

[fol. 7936] (e) Organizing the corporation and placing it in readiness to do business:

The originating group would be jointly responsible with the fiscal agents for the corporate organization, preparation of mortgages, indentures, and other similar details. This work would require numerous group conferences with attendant expenses.

The originating group would be largely responsible for the selection of all executive officers who would be installed upon the perfection of corporate organization. The type

of personnel assumed for the originating group would permit the securing of the character of executives now in charge of the operations of Lone Star Gas Company and correspondingly reduce the probability of executive turnover or improvident management during the construction period.

The Extent of the Participation of the Originating Group in Permanent Financing:

It has been assumed that the most advantageous financial structure would consist of an issue of bonds for 50% of the total requirements, an issue of preferred stock for 25% of the requirements, and the 25% remaining provided for by the issuance of common shares. It was further assumed that together with the common shares issued to them for their expenses during the development period, the value of the capital assets transferred to the corporation and their promotion fee, the originating group would assume the responsibility for placing all other common shares issued, or otherwise expressed, would provide all equity [fol. 7937] money.

This last assumption would relieve the corporation of all marketing costs that would normally be incurred in disposing of the class of securities carrying the heaviest brokerage charges. The value of the service would also be reflected in the sale price of the senior securities.

Expenses of Originating Group Included in Their Remuneration:

Nothing has been included in this estimate for the office expenses, clerical salaries, traveling and other expenses that would be incurred by the individual members of the originating group during the development and organization period.

Each member of the group would require offices and clerical assistants throughout the periods. Numerous conferences between the individuals of the group and between the group and the fiscal agents, together with conferences with prospective consumers and owners of distribution plants, would result in large expenditures for traveling and incidental expenses. All of these items have been included in the promotion fee.

Fees Normally Expected and Received:

The fees received for recent natural gas promotions afford a check upon the reasonableness of the amount included in this estimate.

It is obvious that no precise appraisal can be made of the value of the character of the services outlined in the foregoing analysis. Consideration must be given to the effect of the various assumptions upon the overall cost of the project as subsequently developed. It would be irrational to assume that the originating group possessed certain qualifications and rendered certain valuable services [fols. 7938-7939] that would entitle them to substantial remuneration and then fail to give effect to these qualifications and services in the subsequent development, and estimates of the general undistributed costs that would be incurred in the reproduction of Lone Star Gas Company as of January 1, 1933.

In this estimate of these elements of cost in reproduction, consideration has been given to these factors and the value of the promotional services has been reflected in the various overhead charges. This is particularly true in reference to Interest During Construction, cost of marketing securities, and the cost of Business Development.

It is estimated that the minimum fee to the originating group for promotional services in the reproduction of Lone Star Gas Company as of January 1, 1933—under the assumptions outlined in the foregoing analysis—would be not less than $2,000,000.00.

This estimate gives no consideration to any loss or gain that might accrue through the transfer to the corporation at their fair market value the proportionate part of the gas reserves of Lone Star Gas Company assumed to be transferred by the originating group at the date of incorporation. Included in this estimate are the expenses of the originating group not specifically included in the items of expense set out in the summary of Preliminary Development and Organization Costs, and interest charges accrued upon the out-of-pocket expenses of the originating group during the development period.

[fols. 7940-7941] Undistributed General Cost

General Summary

Executive Section	$503,487
Legal Section	490,576
Accounting Section	192,320
Treasury Section	97,509
Land Section	277,138

[fol. 7942] Undistributed General Costs

The undistributed general costs that would be incurred in the reproduction of the physical property of Lone Star Gas Company as of January 1, 1933, from the date of incorporation to the time when such charges would not be attributable to the construction of the physical entity would be as follows:

1. Administration and Legal Costs.

2. General Engineering Costs.

3. General Supervision of Construction Costs.

4. Taxes on Non-operative Property (exclusive of general office building and general office land, and parking lot).

5. Interest on expenditures attributable to non-operative property.

The estimated costs that would be involved in each of the foregoing accounts have been developed in detail in the subsequent sections of the appraisal.

Before proceeding to these detailed analyses, consideration will be given to certain general factors that would have a direct bearing upon these costs.

Pre-Construction and Construction Periods:

In the estimate of each of the Undistributed General Costs, the element of time is a most important factor. It is the multiplier that must be applied to the salaried personnel engaged in the various activities of the several departments, and it is a function of the cost of interest and of taxes applied to non-operative property and accrued during the period of construction.

In this estimate, a period of three and one half years from the date of the incorporation of the company has been [fol. 7943] adopted as representing the minimum time that would be required in which to economically reproduce the physical property of Lone Star Gas Company as of January 1, 1933, and of this three and one-half year period, six months has been allocated to the necessary work that would be done in connection with the various preliminary steps that would precede construction of the plant. In the case of the general engineering work, a period of six months after the completion of the physical property would be required for the preparation of the final engineering records. In the case of the general stores organization, a period of six months following the completion of the construction of the physical property would be required for the purpose of preparing final inventories, furnishing completion reports, and accounting for the final disposition of surplus material attributable to construction. In connection with the accounting, or records section, at least six months subsequent to the completion of the physical property would be required for the checking and closing of construction records. With these exceptions, all estimated expenditures for Undistributed General Costs would be incurred within the three and one half year period adopted.

The duration of the pre-construction and construction periods has been determined after a careful study of the amount and character of the work that would be involved in the various preliminary steps that would precede and be essential to the initiation of construction, the amount of work that would be done in construction, and the sequence in which the individual units of physical property would be begun and completed.

In this connection, consideration has necessarily been [fol. 7944] given to the fact that the development of the estimated direct cost of reproducing the physical property

has been based upon the assumption that the company would organize its own construction forces and complete the plant without the intermediary services of a general engineering contractor. This basic assumption, in reference to the development of the unit costs of physical property which results in the elimination of contractor's profit and the use of contractor's equipment and personnel, would create the necessity for the prompt organization immediately following the incorporation of the company, of the various departments that would be responsible for the preparation of engineering plans, the securing of rights-of-way, the purchase and delivery of materials, the construction of the plant, and the keeping of records and accounts.

Consideration has also been given to the fact that during the progress of construction certain portions of the completed plant would pass into partial operation, and such charges to constructions as would be reduced by reason of this fact have been properly adjusted in order to give effect to such operations.

General Organization Plan:

The general organization plan that has been adopted as the basis for the development of the personnel, and the responsibilities of the executives and department heads who would be engaged in the administrative and other functions of management during the pre-construction and construction periods, follows very closely the general organization plan of Lone Star Gas Company as a going concern jointly engaged in construction and operation. Certain sections that are strictly operative in their functions have been eliminated. In addition to specific eliminations, the rela- [fol. 7945] tions of some of the department heads have been modified to conform to the requirements of an organization in construction only. With these exceptions, the general organization plan of Lone Star Gas Company has been strictly adhered to in the estimate of Undistributed General Costs.

Figure (1) is the general organization chart covering the executive groups and the departmental heads included under Administration and Legal Costs, General Engineering Costs and General Supervision of Construction Costs. This general chart provides the basis for the detailed organization charts that have been used in the subsequent analyses of the personnel that would be required for the various sections.

General Methods Employed:

In the subsequent development of the estimates of Administration and Legal Costs, General Engineering Costs, and General Supervision of Construction Costs that would be incurred in the reproduction of Lone Star Gas Company as of January 1, 1933, the actual executives of the company and the actual departmental heads, as of that date, have been used as the basis for the estimate. This is also true of the subordinate personnel. The number of men that would be engaged in the work required of the various sections, and the respective duties of each man have been determined after a careful study of each section with reference to its personnel and the duties of the various employees during the periods in which Lone Star Gas Company was engaged in its largest construction programs. These analyses were made in conjunction with the department heads having responsible charge of the sections during these construction periods.

[fol. 7946] During the years 1927 and 1929, Lone Star Gas Company (in conjunction with Community Natural Gas Company) was engaged in construction programs that involved expenditures in excess of $10,000,000.00 during each of these years, and the experience of the company afforded a rational basis for estimate.

In fixing salaries, consideration has been given to the fact that a trained organization, at least with reference to department heads and key men, would be required from the date of incorporation. In order to secure such an organization, trained men would necessarily be taken from the personnels of other companies engaged in similar activities. Men employed under these conditions expect and receive salaries in excess of those that they formerly received.

In several of the departments engaged in the reproduction of Lone Star Gas Company, a substantial part of the personnel would be temporarily employed. This is particularly true with reference to the engineering and construction sections, and the salaries of the employees who would not be retained as a part of the operating organization have been adjusted to meet this condition.

The trained organization of Lone Star Gas Company as of January 1, 1933 is an element of value that should be considered and appraised as a part of the present worth of the company. A separate allowance has been made to provide for this element of value.

Consideration must therefore be given to the cost of securing this organization if the present value of the company is to be reflected in the appraisal.

The number of men engaged in the work of the various [fols. 7947-7948] departments, would, in some cases, vary as the successive steps of the work progressed, and as the constituent elements of property passed from construction into operation. During the construction period there would be a division of responsibility on the part of some of the executive and administrative groups.

These changes, and the division of responsibility between operation and construction during the construction period would require adjustments in personnel, and a rational allocation of general costs proportionate to the relative amount of time required for operation and construction on the part of those jointly engaged.

In order that these adjustments and allocations might be made with relative accuracy, a careful study has been made of the rate at which necessary personnel would be required, the rate at which the construction would proceed, and the rate at which expenditures would be made from the date of incorporation to the date of the completion of the physical property. A study has also been made of the time at which the various sections of the completed system would pass into partial operation during the construction period. The results of these studies have been set out in connection with the development of the Cost of Interest During Construction.

[fol. 7949] Administration and Legal Costs

General Summary

Executive Section		$503,487
Legal Section		490,576
Accounting Section		192,320
Treasury Section		97,509
Land Section		277,138
Geological Section		255,929
Purchasing Section:		
Purchasing Division	$217,918	
General Stores	225,690	
Stationery Division	61,482	
Traffic Division	25,546	
		530,636
Total		$2,347,595

[fol. 7950] Administration and Legal Costs

Definition:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company, Administration and Legal Costs are intended to cover the salaries and expenses of executive officers from the date of incorporation until such time as the property under construction would pass into operation. Also the salaries and expenses of the department heads, clerks and other employees, office rent or its equivalent cost, depreciation on equipment; expenses and supplies in connection with the accounting, purchasing, general stores, traffic, land and lease, and geological departments; also all expenditures that would be incurred by the legal department, including the pay and expenses of counsel, solicitors and attorneys, their clerks and assistants, and the expenses of their offices; the cost of printing briefs, legal forms, payments to arbitrators, witness and notorial fees, and other like costs.

In connection with the determination of the construction period, it was estimated that corporate organization would be perfected at least six months prior to the beginning of actual construction. In view of the magnitude of the undertaking, and of the various steps that would necessarily be

taken before the construction program could be entered upon, six months would be the minimum time that would be required to prepare final plans, assemble an administrative, engineering, and construction organization; purchase and secure the delivery of equipment and the materials of construction.

In the detailed analyses of the various sections that [fols. 7951-7952] would be engaged in the work classified under the general head Administration and Legal Costs, care has been taken, wherever possible, to include only the personnel that would be required for construction only.

In each case where there would be a division of responsibility arising from the fact that a portion of the property would become operative during the construction period, proper effect has been given to this fact.

[fol. 7953] Administration and Legal Costs

Executive Section

General Summary

Salaries	$397,925
Office Furniture and Fixtures (Depreciation Only)	5,341
Stationery and Supplies	5,610
Transportation (Cost of Operation plus Depreciation)	19,173
Traveling Expenses	57,750
Communication Expense	17,688
Total	$503,487

[fol. 7954] Executive Section

Summary of Cost

Pre-Construction Period:

Salaries	$72,350
Office Furniture and Fixtures (Depreciation Only)	971
Stationery and Supplies	1,020
Transportation (Cost of Operation plus Depreciation)	3,486
Traveling Expenses	10,500
Communication Expense	3,216
Total	$91,543

Summary of Cost—Continued

Construction Period-First Year:

Salaries	$144,700
Office Furniture and Fixtures (Depreciation Only)	1,942
Stationery and Supplies	2,040
Transportation (Cost of Operation plus Depreciation)	6,972
Traveling Expenses	21,000
Communication Expense	6,432
Total	$183,086

Construction Period-Second Year:

Construction Period—Second Year:

Salaries	$108,525
Office Furniture and Fixtures (Depreciation Only)	1,457
Stationery and Supplies	1,530
Transportation (Cost of Operation plus depreciation)	5,229
Traveling Expenses	15,750
Communication Expense	4,824
Total	$137,315

Construction Period—Third Year:

Salaries	$72,350
Office Furniture and Fixtures (Depreciation Only)	971
Stationery and Supplies	1,020
Transportation (Cost of Operation plus depreciation)	3,486
Traveling Expense	10,500
Communication Expense	3,216
Total	$91,543

[fol. 7955]. Executive Section

General Organization Plan and Duties of the Section:

The Executive Section is that section of the general organization that would be responsible for the general policies

of the company, the procuring of funds for the construction of the property, the negotiating and making of contracts and the employment of department heads. Through the individual executives, the section would also be responsible for the work of all other sections of the general organization that would be engaged in the reproduction of the property and business of Lone Star Gas Company.

The Executive Section would necessarily be engaged and would begin to function immediately upon the completion of the corporate organization, and would continue to direct all of the affairs of the company throughout the pre-construction, construction, and post construction periods.

In conformity with the general plan of this appraisal, the development of the personnel and the duties of the executive section has been based upon the existing personnel of the company, and the duties that have been ascribed in the estimate to the various individual executives conform to the actual duties and responsibilities of these officers in connection with their work when Lone Star Gas Company has been engaged in its major construction programs.

It has been assumed that the individual members of the executive section would become the operating officers of the company upon the completion of its construction program. For this reason, these individual officers would become responsible for the operations of the company as its completed units passed from construction to operation during [fol. 7956] the construction period. Account has been taken of the fact in the allocation of the costs of the section, and the proportionate part of the cost attributable to operation during construction has been deducted from the estimate.

Personnel Analysis:

The following enumeration set out the duties and contacts of the individual officers and employees included in the Executive Section.

President of the Company:

Under the organization plan adopted, the general duties of the president, insofar as his duties would relate to the construction of the property and the development of its business, would be as follows:

1. He would select and engage the services of the executive personnel.

2. He would generally direct all other executive officers.

3. He would determine all matters of general policy.

4. He would conduct all negotiations with fiscal agents.

5. He would conduct all negotiations with owners of distributing plants in cities proposed to be served with natural gas.

6. He would conduct all negotiations with utility operations concerning the construction of distribution plants in cities and towns adjacent to the proposed system, but in which no distribution facilities existed at the time of the initiation of the project.

7. He would conduct all negotiations with large prospective purchasers of natural gas for industrial use.

8. He would make contact with and conduct any necessary negotiations with governmental and regulatory authorities.

9. He would check and approve all estimates of cash requirements for construction, drilling of wells, purchase of leases, and other expenses that would be incident to the reproduction of Lone Star Gas Company.

10. He would check and approve monthly and quarterly progress reports made to the fiscal agents, the directors and the stockholders.

[fol. 7957] Assistant to the President:

The general duties of the assistant to the president would be as follows:

1. He would secure information from all departmental heads, and prepare progress reports and special reports to the fiscal agents, the board of directors, and the stockholders.

2. He would keep the president advised on all matters pertaining to construction, drilling of wells, acquisition of leases, budgets, and other matters of similar nature.

3. He would familiarize himself with and advise the president and other executives relative to progress made by other utility companies in extending their plants and preparing them for the use of natural gas, and in construcing new

plants for the reception of service coincident with the completion of the pipe line system.

4. He would assist the president in presenting statistical and other information to the fiscal agents, the board of directors, and the stockholders.

5. He would see that all matters of general policy determined upon by the president were properly carried out.

Vice President and General Manager:

The duties of the vice president and general manager would be as follows:

1. He would interview and be responsible for the employment of the following departmental heads:

a. General superintendent of construction.
b. Chief engineer.
c. Chief geologist.
d. Chief land and lease agent.
e. General purchasing agent.

2. He would be responsible for the general design of the system, the standards of construction employed and the standards of materials used in construction.

3. He would be responsible for the purchase of the major items of equipment.

4. He would be responsible for the final selection of prospective gas acreage to be acquired.

5. He would be responsible for the final location of wells to be drilled.

6. He would be responsible for the making of gas purchase contracts.

7. He would be finally responsible for the cost and quality of all constructions.

[fol. 7958] 8. He would be responsible for the preparation of reports on progress of construction, acreage acquired, wells drilled, cash requirements for future construction and other matters pertaining to construction.

9. He would consult in reference to all rate schedules for the sale of domestic gas and prepare schedules for the sale of gas for special and industrial purposes.

Vice President and General Counsel:

The general duties of the vice president and general counsel would be as follows:

1. He would organize and be responsible for the legal department.

2. He would be responsible for the selection and retention of all local counsel.

3. He would be responsible for the preparation of all contracts, and the conduct of all litigation arising from the progress of construction, and the development of business.

4. He would be responsible for all corporate matters and all legal questions growing out of the mortgage and its provisions.

5. He would advise all other executives relative to the conduct of their work with reference to its legal phases.

6. He would be finally responsible for all titles.

7. He would be responsible for the final settlement of all claims.

8. He would assist the president in all negotiations with governmental agencies, and be responsible for all franchises.

9. He would have general supervision of the Land and Lease and Rights-of-Way Departments.

Secretary and Treasurer:

The general duties of the secretary and treasurer would be as follows:

1. He would interview and be responsible for the employment of:

a. Comptroller.
b. Assistant treasurer.
c. Assistant secretary.

2. He would be responsible for the adoption of a classification of accounts for the company.

3. He would be responsible for the initiation of the general accounting system.

4. He would be responsible for the initiation of the tax and insurance records.

[fol. 7959] 5. He would be responsible for the selection of insurance companies that would handle all classes of company insurance.

6. He would be responsible for the proper contacts between the company and tax authorities.

7. He would be responsible for the preparation and filing of all corporate reports required by County, State and Federal authorities.

8. He would be responsible for all cash receipts and disbursements.

9. He would be responsible for stock records and transfers, and the listing of stock on exchange.

Assistant Secretary:

The duties of the assistant secretary would be as follows:

1. He would be directly responsible for the initiation and handling of all insurance and tax records.

2. He would be directly responsible for the preparation and filing of all required corporate reports with County and State.

3. He would be directly responsible for the proper contacts between the company and tax authorities.

4. He would be directly responsible for all settlements with insurance companies covering insurable losses suffered by the company.

5. He would assist the secretary and treasurer in all secretarial duties.

Chief Clerk to Vice President and General Manager:

1. He would be directly responsible for the handling of all reports and other office duties in connection with the general duties of the vice president and general manager.

In addition to general officers and assistants whose duties have been specifically enumerated, five secretaries and an information clerk would be required to properly handle the office details of the Executive Section.

Schedule of Salaries:

The schedule of salaries adopted has been based upon the actual salaries of the executive officers of Lone Star Gas Company when in construction and operation, together with a reasonable allowance for the premium that would necessarily be paid in order to secure the type of personnel re-
[fol. 7960] quired from other similar organizations and certain allowances in specific instances for the increase in responsibilities that the wholesale reproduction of Lone Star Gas Company would impose.

Position	Per Anum
President	$40,000
Vice President and General Manager	30,000
Vice President and General Counsel	20,000
Secretary and Treasurer	18,000
Assistant to the President	12,000
Assistant Secretary	6,000
Chief Clerk to Vice President and General Manager	4,000
Secretary to the President	3,600
Secretary to the Vice President and General Manager	2,700
Secretary to the Vice President and General Counsel	2,400
Secretary to the Secretary and Treasurer	2,100
Secretary to the Assistant to the President	2,400
Information Clerk	1,500
Total	$144,700

In the distribution of annual charges for salaries and other expenses attributable to the Ex-cutive Section an allocation has been made upon the assumption that all expenses would be chargeable to construction during the pre-construction period, and the first construction year, that seventy five per cent of all expenses would be chargeable to construction during the second construction year, and that fifty per cent of all expenses would be chargeable to construction during the final construction year.

This allocation of salaries and expenses fairly reflects the proportionate amount of time that the members of the executive group would devote to construction and operation during the construction period.

Office Furniture and Fixtures:

The following summary sets out the reproduction cost as of January 1, 1933, of the office furniture and fixtures of the [fol. 7961] personnel of the Executive Section that would be engaged during the pre-construction and construction periods. As an expense during these periods, depreciation at an annual rate of eight per cent per annum has been allocated to construction and operation as previously outlined.

Summary

Office of Assistant to President	$1,066
Office of Secretary to Assistant to President	641
President's office	4,873
Office of Secretary to President	1,479
Vice President's office	2,374
Office of Assistant to Vice President	1,071
Office of Secretary to Vice President	641
Information Clerk's office	963
Ante room	526
Office of Secretary to Secretary and Treasurer	948
Secretary and Treasurer's office	1,601
Office of Assistant Secretary	1,324
Office of Secretary to General Counsel	601
Office of Vice President and General Counsel	2,078
Vault equipment	962
Carpet for all offices	3,131
Total	$24,279

Stationery and Office Supplies:

The estimate of stationery and office supplies is based upon the per man per annum consumption applied to the purchasing and stores department.

It has been estimated that the lower rate of consumption would be balanced by the higher quality of stationery and supplies used by the company executives. The estimated expense by periods is as follows:

Pre-construction Period	$1,020
First Construction Year	2,040
Second Construction Year	2,040
Third Construction Year	2,040
Total	$7,140

[fol. 7962] Transportation Expenses:

It has been estimated that two Packard Sedans would be required for the Executive Section, one for the exclusive use of the vice president and general manager, and one for the general use of resident members of the Executive Section.

The estimated annual cost of transportation expenses is as follows:

1 Packard Sedan—Cost $2970—Depreciation at 25 per cent	$742
1 Packard Sedan—Cost $2970—Depreciation at 33 per cent	990
1 Packard Sedan—12 000 miles at 7 cents per mile	840
1 Packard Sedan—25 000 miles at 8 cents per mile	2,000
2 Chauffeurs at $100 per month each	2,400
Total	$6,972

The estimated cost of transportation by periods is as follows:

Pre-construction Period	$3,484
First Construction Year	6,972
Second Construction Year	6,972
Third Construction Year	6,972
Total	$24,400

Traveling Expenses:

The traveling expenses of the individuals of the Executive Section has been estimated as follows:

Officer	Per Month	Per Annum
President	$750	$9,000
Vice President and General Manager	300	3,600
Vice President and General Counsel	200	2,400
Secretary and Treasurer	150	1,800
Assistant to the President	200	2,400
Assistant Secretary	150	1,800
Total		$21,000

The estimated cost of traveling by periods is as follows:

Pre-construction Period	$10,500
First Construction Year	21,000
Second Construction Year	21,000
Third Construction Year	21,000
Total	$73,500

[fols. 7963-7964] Communication Expense:

The expense of telegrams, tolls and telephones has been based upon the actual experience of the Executive Section taken in connection with the fact that the present company system would be incorporated during a substantial part of the construction period.

	Per Month	Per Annum
Telegrams and Tolls	$450	$5,400
Telephones 13 at $6.60 each	86	1,032
Total		$6,432

The estimated cost of communication by periods is as follows:

Pre-construction Period	$3,216
First Construction Year	6,432
Second Construction Year	6,432
Third Construction Year	6,432
Total	$22,512

[fol. 7965] Administration and Legal Costs

Legal Section

General Summary

Salaries	$138,120
Retainers and Fees	97,600
Court Costs and Expenses	179,879
Stationery, Office Supplies and Annual Service	7,499
Transportation Expense	13,368
Traveling Expenses	22,950
Communication Expenses	24,826
Office Furniture and Fixtures and Library (Depreciation Only)	6,334
Total	$490,576

[fol. 7966] Legal Section

Summary of Costs

Pre-Construction Period:	
Salaries	$18,510
Retainers and Fees	
Court Costs and Expenses	22,195
Stationery, Office Supplies and Annual Service	1,084
Transportation (Cost of Operation Plus Depreciation)	1,671
Traveling Expenses	2,850
Communication Expenses	2,765
Office Furniture and Fixtures and Library (Depreciation Only)	845
Total	$49,920
Construction Period—First Year:	
Salaries	$41,220
Retainers and Fees	26,600
Court Costs and Expenses	45,163

Retainers and Fees	28,400
Court Costs and Expenses	45,163
Stationery, Office Supplies and Annual Service	1,797
Transportation (Cost of Operation Plus Depreciation)	3,342
Traveling Expenses	5,400
Communication Expenses	6,950
Office Furniture and Fixtures and Library (Depreciation Only)	1,689
Total	$125,111

Post-Construction Period:

Salaries	$9,225
Retainers and Fees	14,200
Court Costs and Expenses	22,195
Stationery, Office Supplies and Annual Service	520
Transportation (Cost of Operation Plus Depreciation)	1,671
Traveling Expenses	1,650
Communication Expenses	1,211
Office Furniture and Fixtures and Library (Depreciation Only)	422
Total	$51,094

[fol. 7968] Legal Section

General Organization Plan and Duties of the Section:

The Legal Section is that part of the general organization that, in the reproduction of the property and business of Lone Star Gas Company, would be responsible for the examination, approval and the drawing up in proper form of all contracts, charters, franchises, easements, deeds, abstracts of title, insurance policies, notes, bonds, mortgages, liens, releases and government reports of all kinds and character as required by the local state and National Governments. This Section would also render such legal advice, opinions and assistance as would be necessary and useful to other Sections of the general organization, and would be responsible for the prosecution and defense of all

suits and litigation for and in behalf of the company during the pre-construction, construction, and post-construction periods that would grow out of the construction of the property and the development of business.

The Legal Section would begin to function as a part of the general organization immediately upon the completion of corporate organization, and would continue to function as a part of the organization required for the reproduction of the property and business of the company throughout the pre-construction and construction periods, and a part of the personnel of the Section would be engaged in work attributable to construction during the post-construction period.

The development of the personnel and duties of the legal Section as set out in this estimate has been based upon the existing personnel of the company, and the duties that have been ascribed to the various individuals of the Section [fol. 7969] conform to their actual duties and responsibilities in connection with their work when Lone Star Gas Company has been engaged in its major construction and expansion program.

In conformity with the general organization plan of the company, and the organization plan adopted as the basis for this estimate, the Legal Section would be under the general supervision of the vice-president and chief counsel, and under the direct supervision of the Section head, who for identification will be called first attorney.

The first attorney and the second attorney would direct the work of the Section, and handle all general matters; the junior attorneys would be assigned to specific duties as will be developed in the personnel analysis.

Personnel Analysis:

Upon the completion of corporate organization, the first attorney would be engaged, and with the co-operation and under the general direction of the general counsel, would immediately begin the organization of the Legal Section. He would assist in the selection of the personnel of the Section, the employing of other attorneys, secretaries and stenographers, and the selection and purchase of law books and the necessary equipment of the Section. Together with the second attorney, he would be responsible for the handling of any suits and litigation occurring during the

pre-construction period, and he would assist the general counsel in an advisory capacity to all other sections functioning during this time. This work would involve the writing of opinions, contracts, leases, and the preparation of forms to be used by the various departments.

[fol. 7970] Three assistant attorneys would be immediately engaged for specific work in connection with the acquisition of leases. Three months prior to the beginning of construction two additional attorneys would be engaged for specific work in connection with the acquisition of rights-of-way, easements, damages growing out of construction, and similar matters. Beginning with the construction period, the seven attorneys as above set out, together with the necessary secretaries and clerks, would constitute the personnel of the Legal Section during the three year construction period.

For at least six months after the completion of construction, at least four of the attorneys would continue to function in connection with litigation that would be carried over from the construction period. A great number of condemnation cases would be pending on appeal in the County Court from the award of the Commissioners at the end of the construction period. There would also be pending a great number of right-of-way damage claims, and suits arising from the work and actions of the company during construction. This work, would of necessity, require the attention of the Legal Section in co-operation with the Claim Division of the Land Section. There would also be a certain amount of unfinished work in connection with curative data, titles, contracts, easements and leases.

As the company passed from construction to partial operation during the construction period, there would be a normal division of responsibility on the part of the first and second attorneys between construction and operation. For this reason, there has been *al* allocation of their salaries, and of the salaries of their secretaries upon the assumption that one fourth of their time would be given [fol. 7971] to operating matters during the second construction year, and one half during the final construction year.

First Attorney:

1. The first attorney, under the general supervision of the vice-president and general counsel, would be respon-

sible for the carrying out of the details of the organization of the Legal Section, and the selection of its personnel.

2. He would direct and assign the work and duties of all employees of the Section.

3. He would be responsible to the general counsel for the preparation and defense of all suits and litigation arising out of the construction of property and the development of the business of the company.

4. He would prepare and give legal advice and opinions to all other Sections and employees of the company on legal questions arising in connection with the construction of the property, and the development of the business of the company.

5. He would prepare and present briefs and agreements in the trial and appeal of the suits and litigation of the company.

6. He would prepare and examine contracts, franchises, easements, deeds, abstracts of title, notes, mortgages, bonds, and the various regulations, ordinances and laws applicable to the company in local, County and State Governments where it would operate.

7. He would co-operate with the Land Section in the examination and preparation of titles, leases and contracts.

8. He would co-operate with the Claim Department in investigating and settling claims and suits, and prospective claims against the company growing out of construction and business development.

Second Attorney:

The second attorney would assist the first attorney in all matters. He would also be responsible for the direction of the Section during the absence of the first attorney.

In connection with the specific duties ascribed to the first attorney, the second attorney would assist in the prepara-
[fol. 7972] tion and trial of cases in the State District Courts, and in the Federal District Court, and in the preparation of appeals, including briefs and arguments as would be necessary in the Appellate Courts, including the Court of Civil Appeals, the State Supreme Court, the United States Circuit Court, and the United States Supreme Court; and he would assist in the marshaling of facts, the preparation of pleadings, the arrangement for

witnesses, and the actual trial and hearing of the cases. Such litigation would involve damage suits, injunction suits, royalty suits involving leases, title suits, and various other litigation.

Together with the first attorney, he would make appearances for, and on behalf of, the company before regulatory bodies such as the Railroad Commission of Texas, the Corporation Commission of Oklahoma, the Highway Commission of both Texas and Oklahoma, tax boards, and other State and National Bureaus and Commissions in matters which would involve the rights and functions of the company during the construction of its property, and the development of its business. These duties would require the preparation of petitions, applications and protests, and the securing of permits, grants from the regulatory boards and Commissions.

Third and Fourth Attorneys:

It would be necessary for the third and fourth attorneys to devote practically all of their time to the handling of condemnation suits and right-of-way difficulties, which would involve or hinder the progress of the various right-of-way crews, and so affect the progress of all construction.

Their duties in this connection would entail the preparation of condemnation petitions, the interviewing and selec-
[fol. 7973] tion of boards of Commissioners, the hearing and trial of the condemnation cases before the Commissioners and the preparation of awards, bonds, easements and right-of-way grants. They would also handle the minor litigation of the company in the Corporation, Justice and County Courts. This work would involve the marshaling of facts, arrangement for witnesses, preparation of arguments and briefs.

The routine work of the third and fourth attorneys would require them to go to various localities where the right-of-way crews would be at work in order to handle the condemnation suits and right-of-way litigation and difficulties which would interfere with the progress of the construction crews. This would require the use of a company automobile by both the third and fourth attorneys.

Fifth, Sixth, and Seventh Attorneys:

The fifth, sixth, and seventh attorneys would devote practically all of their time to the examination of abstracts,

titles, and leases. This work would involve the examination of thousands of abstracts of title in view of the assumption that one-half of the mineral leases now owned by Lone Star Gas Company would be acquired during a three and one-half year period. Their work would also involve the examination of abstracts of title of the various regulator and measuring station sites, and all property acquired by the company.

It would also be the duty of the fifth, sixth, and seventh attorneys to handle probate matters and minor litigation involving the clearing of titles to be acquired by the company. It would also be their duty to prepare and examine leases, deeds, contracts, and easements, and to assist the third and fourth attorneys in the handling of the minor litigation of the company.

[fol. 7974] A portion of the time of these attorneys would be required in the various gas fields in which the company holds leases, for the preparation of deeds, easements, leases, affidavits, and other curative data necessary for the clearing and approval of titles to the leases and property acquired by the company. At least one company automobile would be required for the prompt discharge of those duties.

Secretaries and Clerk:

During the time that each of the attorneys would be engaged during the pre-construction and construction periods, a secretary would be required to handle the work of each attorney. It would also be necessary to employ a file clerk and librarian.

The secretaries would be continuously engaged in handling the work and correspondence of the various attorneys. They would keep the setting of cases, prepare files, and prepare and furnish file data, take dictation, write interoffice communication, opinions, briefs, contracts, and all forms and character of instruments as directed by the various attorneys. They would be required to keep the files and offices of the individual attorneys, answer phone calls, and assist generally in handling the business of the Section.

The clerk would be responsible for the care of the general files, the arranging of the library and keeping it in proper order, and checking books and periodicals coming into the library. This clerk would also receive and direct all visi-

tors and persons having business with the various individuals of the Section, and would make appointments for them.

Local Attorneys on Retainer:

It has been found both economical and generally advis- [fol. 7975] able, in the construction history of Lone Star Gas Company, to retain local counsel at strategic points on the system. Their familiarity with local conditions would be helpful to the company's attorneys. They would be able to handle local matters promptly and in many cases make more favorable adjustment of claims than would otherwise be possible. They would also save the time and expense of company attorneys by removing the necessity for frequent trips to various parts of the system under construction.

Beginning with the first year of the construction program, local attorneys would be retained in the following cities:

	Per Annum
Duncan, Oklahoma	$600
Durant, Oklahoma	600
Oklahoma City, Oklahoma	1,000
Wichita Falls, Texas	600
Fort Worth, Texas	1,000
Eastland, Texas	600
Abilene, Texas	600
Waco, Texas	600
Corsicana, Texas	600
Greenville, Texas	600
Sherman, Texas	600
Austin, Texas	1,000

These attorneys would be retained as the progress of construction demanded their services.

It would be necessary to pay to the local attorneys fees for such cases or litigation as might be handled by them in their respective Sections. The retainer's fees would simply cover such incidental advice and office work as they would be called upon to do for the company.

In addition to the foregoing retainers, it would be necessary for the company, in the most important cases involving considerable sums of money, to employ other local attorneys residing at the location or point where such litiga- [fol. 7976] tion arises. The matter of compensation to these attorneys would depend upon the amount of litigation

the company might have on which it would be advisable to employ such attorneys. An annual sum of not less than $20,000 would be required for this purpose.

Schedule of Salaries:

Position	Rate Per Month	Rate Per Annum
First Attorney	$750	$9,000
Second Attorney	450	5,400
Third Attorney	275	3,300
Fourth Attorney	275	3,300

Fees	20,000
Total	$28,400
Third Construction Year	$28,400
Post-Construction Year	$14,200

• • • • • • •

Court Costs and Expenses:

Based upon the experience of Lone Star Gas Company in construction, approximately two hundred suits per annum would grow out of the three year construction program. These suits would be in addition to those growing out of the condemnation of rights-of-way, the expenses of which have been included as a part of the direct structural costs [fol. 7979] as transmission system right-of-way. These suits would consist of miscellaneous damage suits, injunctions, trespass to try title, royalty suits, lease suits, and other similar cause for litigation.

The experience of the company further indicates that for every two hundred suits filed one hundred would come to trial with approximately twenty-five originating in the Justice Court, twenty-five in the County Courts, and fifty in the State and Federal District Courts. The average cost of these suits has been found to be as follows:

Justice Court:

Court Costs	$7.50
Subpoena and Witness Fees	35.00
Total	$42.50

County Court:

Court Costs	$15.00
Subpoena and Witness Fees	45.00
Total	$60.00

District Court:

Court Costs	$25.00
Subpoena and Witness Fees	100.00
Total	$125.00

Of these suits originating in the Courts designated, it is estimated that fifteen would be appealed from the Justice to the County Court, and of these fifteen appeals, at least five would be subsequently appealed from the County

Courts; that of the cases originating in the County Courts, fifteen would be appealed to the higher Courts; and that of the cases originating in the District Courts, twenty five would be appealed. The estimated cost of these appeals is as follows:

[fol. 7980] Justice to County Courts:

Preparation of Transcript and Record for Appeal	$15.00
Cost of Trial in County Courts	60.00
Total	$75.00

County Courts to Appellate Courts:

Statement of Facts and Transcript	$150.00
Court of Civil Appeals Costs	75.00
Printing Briefs	125.00
Copy of Opinion	10.00
Bond Cost	10.00
Incidental Charges	10.00
Total	$380.00

District Court of Appeals:

Statement of Fact and Transcript	$200.00
Appellate Court Costs	100.00
Printing Briefs	200.00
Copy of Opinion	20.00
Bond Cost	50.00
Incidental Charges and Costs	25.00
Total	$595.00

None of the foregoing estimates of cost include any allowance for expenses of counsel, stenographic services, and legal fees.

[fol. 7991] Accounting Section

General Organization Plan and Duties of the Section:

In general the duties of the Accounting Section used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company as of January 1, 1933, conform to the duties of any well organized accounting department of the general organization of a company engaged in an extensive construction program. Specifically the duties herein assigned to the Section as a whole, and to the various individuals who would be engaged in accounting work, conform to the duties of the Section and the responsibilities of the individuals when Lone Star Gas Company has been engaged in extensive construction programs.

In the reproduction of the property and business of the company, it would be the duty of this Section to keep proper records of all monies disbursed, and to properly distribute and allocate all charges as prescribed by the Standard Classification of Accounts. It would also be its function to make certain that the proper approved authorizations would be attached to and made a part of each voucher disbursing funds. It would also be the duty of the Section to prepare regular and special reports covering expenditures, property additions, monies advanced, and other kindred matters. After provision had been made for proper supervision, the Section would be divided into three general di-

visions—The General Book Division, the Distribution Division, and the Plant and Equipment Division. The general duties of these divisions are briefly outlined in the following summary:

General Book Division:

The General Book Division would keep the general books [fol. 7992] of the company. It would keep all subsidiary records other than those pertaining to property. It would prepare monthly financial reports, and special reports. It would check and approve vouchers passing through the Section. It would do all comptometer and typing work for the Section, and file all vouchers, transfers, expense accounts, and all other miscellaneous papers.

Distribution Division:

The Distribution Section would distribute all charges to various job orders as provided for in the Standard Classification of Accounts. It would also be the duty of this division to check all vouchers in order that they might be properly supported with copies of orders, material recovery reports, or other evidences of the delivery of the material covered by the various invoices.

Plant and Equipment Division:

The Plant and Equipment Division would be responsible for the posting of all charges to various job orders covering units of construction. It would check all charges made to job orders against engineering records, prepare all data in support of vouchers clearing construction, and charges to permanent investment. It would also post and keep current all permanent investment records covering all classes of property.

Personnel Analysis:

Comptroller:

The comptroller would be in responsible charge of the work of the Accounting Section. He would be directly responsible to the secretary and treasurer, and would be employed immediately upon the completion of corporate organization. During the pre-construction period his duties would be as follows:

[fol. 7993] 1. He would secure data on and make recommendations concerning the adiption of a standard classification of accounts for the company.

2. He would secure data on and make recommendations concerning the adoption of a modern and approved accounting system.

3. He would confer with all Section and Division heads with reference to the types of reports to be prepared by them for use by the Section and Division heads, the responsible executives, and the Accounting Section.

4. He would prepare the personnel scheme of the Accounting Section, and then confer with the personnel manager relative to the engagement of employees with proper qualifications. He would also interview prospects secured by the personnel manager, and approve or disapprove the various individuals recommended.

5. He would be responsible for the preparation of all accounting forms, and he would also assist other Sections in the preparation and selection of forms for their specific needs.

6. He would confer with the assistant secretary, the Tax Division, and other sections and divisions relative to the kind of information that would be required from the Accounting Section for the proper preparation of the various forms of governmental reports.

7. He would generally supervise the work performed by the Accounting Section.

During the construction period, the general duties of the comptroller would be similar to those above outlined with an increase in responsibility in connection with the direction of the Section due to the increase in personnel that would take place upon the beginning of actual construction.

It has been assumed that during the first construction year, the entire time of the comptroller would be devoted to construction records and other classes of work pertaining wholly to construction. During the second construction year, it has been assumed that a proper division of his time and responsibilities would be seventy-five per cent to con-
[fol. 7994] struction and twenty-five per cent to operation. During the third construction year, it has been assumed

that his time and responsibilities would be equally divided between construction and operation. During the first year in which the company would be wholly operative, or the post-construction period, it has been assumed that twenty-five per cent of his time and responsibilities would be devoted to the work of his Section that would grow out of the construction of the plant.

General Auditor:

The general auditor would be directly responsible to the comptroller, and would be employed immediately after the perfection of corporate organization. His general duties during the pre-construction period would be as follows:

1. He would assist the comptroller in all matters pertaining to the organization of the Accounting Section, and to its operation after organization.

2. He would work out all details in connection with the preparation of accounting forms, and check all proofs received from printers and stationers.

3. He would be directly responsible for the supervision of the work of the Section.

4. He would be responsible for the final accounting approval of all vouchers prepared by or passed through the Accounting Section.

The duties of the general auditor during the construction and post-construction periods would conform to those above outlined. There would be a reduction in the amount of time required for the preparation and approval of forms, and a heavy increase in the proportionate amount of time required for the supervision of the Section, the approval of vouchers and other routines. The division of the general auditor's time between construction and operation after the end of [fol. 7995] the first construction year conforms to that set out under the discussion of the duties of the comptroller.

Traveling Auditor:

The traveling auditor would be directly responsible to and work under the supervision of both the comptroller and the general auditor. The position of traveling auditor would not be filled until the beginning of actual construction,

however, it would be necessary that he be retained for a period of six months following the completion of construction, and during this time his salary and expenses would be charged to construction. His duties during the entire period of his employment would be as follows:

1. He would check monthly all working funds in possession of the superintendents of the Construction Section.

2. We would act as contact man between the Accounting Section and the field construction personnel.

3. He would advise and instruct all persons having working funds with reference to the proper methods of preparing disbursement reports and other matters of a similar nature.

4. He would prepare a report showing the result of each individual audit made in the field.

5. He would follow up, under the direction of the comptroller or general auditor, each recommendation in his audit reports for the purpose of seeing that these recommendations were followed.

Secretary to the Comptroller and General Auditor:

The secretary to the comptroller and general auditor would handle all correspondence of their offices, receive and distribute all incoming and outgoing mail, and perform other secretarial duties. He would also type audit reports prepared by the traveling auditor, and assist in the handling of the correspondence of the chief clerks of the Section.

[fol. 7996] General Book Division:

Chief Clerk:

The chief clerk of the General Book Division would be directly responsible to the general auditor, and he would be employed immediately upon the completion of corporate organization. During the pre-construction period his duties would be as follows:

1. He would check and approve all vouchers passing through the Accounting Section.

2. He would be responsible for the compilation of all special reports pertaining to general matters, or all reports

other than detailed reports covering property or property additions.

3. He would prepare all vouchers covering storehouse transfers, automobile time sheets, prepaid rentals, and other similar matter.

4. He would prepare all monthly financial reports.

Following the pre-construction period, and during the construction period, the chief clerk would be unable to perform all of the duties set out, and his work would be limited to the following:

1. He would check and approve all vouchers passing through the Accounting Section.

2. He would be responsible for the compilation of all special reports other than those pertaining to property and property additions.

3. He would supervise generally the work of the General Book Section.

Assistant Chief Clerk:

The position of assistant chief clerk would not be filled until the beginning of actual construction, therefore no charges have been included for the expenses of this office during the pre-construction period. His specific duties would be as follows:

1. He would assist the chief clerk in all matters delegated to him.

[fol. 7997] 2. He would prepare all monthly financial reports under the direction of the chief clerk.

3. He would assist in the preparation of all special reports.

4. He would assist in the performance of all miscellaneous duties arising from work of the General Book Division.

General Clerk:

The position of general clerk would not be filled until the beginning of actual construction, therefore no charges have been included for the expenses of this office, that is, during the pre-construction period. His particular duties would be as follows:

1. He would assist, when necessary, in the preparation of special reports.

2. He would be directly responsible for the preparation of miscellaneous vouchers covering storehouse transfers, automobile time sheets, teaming tickets, prepaid insurance, prepaid rentals, and all other miscellaneous vouchers.

3. He would assist in miscellaneous work that would be required of the General Book Division.

Posting Machine Operator:

The posting machine operators would be directly responsible to the chief clerk. He would be employed immediately after the perfection of corporate organization. The duties of this operator during the pre-construction and construction periods would be as follows:

1. He would post all charges to the general ledger as well as charges to the subsidiary ledgers from all vouchers passing through the Section.

2. He would take off monthly trial balances from the general ledger and subsidiary ledgers, and transfer them to the chief clerk or assistant chief clerk for use in the preparation of monthly financial reports.

3. Assist in any other miscellaneous work of the Division.

[fol. 7998] Comptometer Operator:

During the pre-construction period, the service of one comptometer operator would be required. With the beginning of actual construction an additional operator would be employed. Both operators would be required during the entire construction period. The duties of the comptometer operators would be as follows:

1. They would check and compute the accuracy of all extensions in all statements prepared by the Division.

2. They would check all storehouse material transfers.

3. They would check all financial statements prepared by the Division, and do all other verification that would be necessary in connection with the operation of the entire Accounting Section.

Typists:

One typist would be employed upon the completion of corporate organization, and one additional typist would be employed upon the beginning of construction. Both typists would be required during the entire construction period. The duties of these typists would be as follows:

1. They would type all miscellaneous vouchers originating in the Section.

2. They would type all special reports prepared by the Section.

3. They would type all financial reports prepared by the Section.

4. They would type all construction reports prepared by the Plant and Equipment Division.

5. They would do all miscellaneous typing that would be necessary in the operation of the Accounting Section.

Voucher Clerk:

The voucher clerk would be employed at the beginning of [fol. 7999] the first construction year. His duties during the construction period would be as follows:

1. After all vouchers had been checked by the chief clerk and passed to the general auditor for further check and approval, they would be returned to the voucher clerk who would place the voucher number thereon. He would also detach the copy of the voucher check after the number had been placed thereon, and transfer it to the filing clerk.

2. He would be responsible for the delivery of all cash vouchers to the Treasury Section for payment.

3. He would assist all other clerks in the General Book Division.

File Clerk:

The file clerk would be employed at the beginning of the first construction year, and his duties during the construction period would be as follows:

1. He would file alphabetically copies of all voucher checks passing through the Section

2. He would assort in numerical order and file storehouse transfers and job tickets.

3. He would file all vouchers upon their return from the Treasury Section.

4. He would file all expense accounts in alphabetical order upon their return from the Payroll Division.

5. He would do all miscellaneous filing required in connection with the work of the Accounting Section.

Office Boy:

An office boy would be required by the Section at the beginning of the construction period. His duties would be as follows:

1. He woud run errands for the Section.

2. He would assist in the operation of Ditto or mimeograph machines in the preparation of all monthly or special reports.

3. He would perform such miscellaneous duties as would be required by the Section.

[fol. 8000] Distribution Division:

Chief Distribution Clerk:

It would be necessary to engage the chief distribution clerk immediately upon the organization of the Section. During the pre-construction period, the chief clerk would be able to handle all work pertaining to the distribution of charges. At the beginning of construction, the personnel of the Division would be increased as hereinafter set out, and all of the time of the chief clerk would be required for the checking and approval of distribution on all vouchers passing through the Section.

Distribution Clerks:

Immediately upon the beginning of construction, two distribution clerks would be required. These clerks would be continuously engaged throughout the construction period, and for a six months period following the completion of construction. The duties of the distribution clerks would be as follows:

1. They would make distribution of charges on all vouchers passing through the Section.

2. They would make distribution on all storehouse material transfers.

3. They would make distribution of all expense accounts.

4. They would make distribution of all automobile time sheets.

5. They would make distribution of charges on all miscellaneous vouchers including pre-paid insurance, rentals, and other vouchers of similar character.

Freight and Express Distribution Clerks:

Two distribution clerks whose duties would be confined to the proper distribution of all charges for freight and express would be engaged at the beginning of the construction [fol. 8001] period. Transportation charges would apply to all materials entering into the construction of the system, and the details handled by these clerks would be volum-ous. They would make distribution of all freight, express, and truck line charges. In order to make proper distribution of these charges, it would be necessary for the clerks to locate original invoices, or transfers covering the materials upon which the transportation charges would apply.

Plant and Equipment Division:

Chief Construction Accountant:

This position would be filled immediately upon the beginning of construction, and the work of the division would require the retention of the chief construction accountant for a six months period following the completion of construction. His duties during the construction and post-construction periods would be as follows:

1. He would supervise the posting to the individual work orders all charges for labor, materials, and miscellaneous items.

2. He would supervise the compiling of all construction costs, the checking against engineer's records and daily performance sheets of construction groups for the purpose of verifying all charges made to the various job orders.

3. He would supervise the compilation of supporting data for vouchers clearing construction accounts, and charges to

the permanent investment accounts as prescribed by the Standard Classification of Accounts.

Construction Accountants:

Two construction accountants would be employed at the beginning of construction. These accountants would be retained for a six months period following the completion of construction. Their duties during the construction and [fol. 8002] post-construction periods would be as follows:

1. They would post to the individual work order number all charges for labor, materials, and miscellaneous items.

2. They would compile all construction costs, check against engineer's records, and daily performance sheets of construction gangs in order to verify all charges made to the various job orders.

3. They would compile supporting data for vouchers clearing construction account, and charges to the permanent investment accounts, classification of same as prescribed by the Standard Classification of Accounts.

4. They would prepare construction completion reports by work order numbers which would show the actual cost of construction. These costs could be compared with estimated costs.

Posting Machine Operators:

Two posting machine operators would be employed at the beginning of construction. These operators would be retained for a six months period following the completion of construction. Their duties during the construction and post-construction periods would be as follows:

1. They would post all charges from all vouchers, both cash and journal, to the classified account as prescribed by the Standard Classification of Accounts to the work order numbers covering construction projects.

2. They would prepare trial balances of the work order ledgers monthly, which would show general information on each work order covering the amount of expenditure authorized, the amount expended during the month, the amount expended to date, total money expended, and the balance under-expended or over-expended.

3. They would assist in the preparation of any special construction reports.

[fol. 8015] Treasury Section

General Organization Plan and Duties of the Section:

The Treasury Section is that Division of the administrative group that in the reproduction of Lone Star Gas Company, would be directly responsible for the receipt and disbursement of all funds, the preparation of budgets and estimates, the reconciliation of bank balances, and all payrolls and expense accounts covering the salaries and expenses of all employees engaged in the construction of the plant.

In conformity with the present organization plan of Lone Star Gas Company, the Treasury Section through the assistant treasurer would be responsible for the selection of the subordinate personnel of all Sections other than those directly responsible for construction.

The Section would be organized immediately upon the completion of corporate organization by the employment of the assistant treasurer who would proceed with the selection of the individual employees of the Section. The organization of the Pay-Roll Division would be completed at a later date, and would not function with its entire personnel until the beginning of actual construction.

In conformity with the adjustments made with reference to the salaries and expenses of the Executive Section due

to the fact that the company would be in partial operation during the construction period, the salaries and expenses of the Treasury Section have been reduced upon the same basis during the second and third construction years.

Personnel Analysis:

Assistant Treasurer and Personnel Manager:

[fol. 8016] The assistant treasurer would be directly responsible to the secretary and treasurer of the company. In the reproduction of Lone Star Gas Company, his duties would be as follows:

1. He would confer with the various Section heads concerning the qualifications of the personnel necessary to fill positions in their offices.

2. He would secure data on and made recommendations concerning the adoption of a modern and approved treasury and payroll accounting system.

3. He would prepare treasury personnel layout, and proceed with the organization of his Section.

4. He would be responsible for the work of the Treasury Section.

5. He would be responsible for the preparation of all cash budgets and other statements of like nature.

6. He would check and approve all cash vouchers passing through the Section and countersign all checks supported by vouchers.

7. He would be responsible for all collections.

8. He would be directly responsible for the placing of fidelity bonds covering positions of trust both in the general office and in the field.

9. He would be responsible for all bank accounts.

10. He would be responsible for all construction payrolls and expense accounts.

Chief Clerk:

The chief clerk of the Treasury Section would be directly responsible to the assistant treasurer. His duties in connection with the work of the Section would be as follows:

1. He would have direct charge of the subordinate personnel and would be directly responsible for the work of the Section during any absence of the assistant treasurer.

2. He would handle all correspondence.

3. He would do all detail work in connection with the preparation of budgets.

[fol. 8017] 4. He would receive and collect all expenditure requisitions submitted by the various Section heads.

5. He would assist the assistant treasurer in all matters arising in connection with the work of the Section.

General Clerk:

The duties of the general clerk would be as follows:

1. He would be directly responsible for the reconciliation of all bank balances.

2. He would be directly responsible for the collection of all accounts and notes due the company.

3. He would assist the chief clerk in the analysis of the estimates of cash requirements submitted by the various Section heads, and would also assist in the preparation of budgets.

Secretary to the Assistant Treasurer:

The secretary to the assistant treasurer would perform all secretarial duties in connection with the work of the Section. He would also make all appointments for all applicants for positions and assist in the preparation and filing of all application forms submitted by applicants.

Typist:

One typist and file clerk would be required for the typing of budgets and reports.

Pay Master:

The paymaster would be directly responsible for the payroll Division of the Treasury Section. His specific duties would be as follows:

1. He would finally check and approve all construction payrolls and expense accounts.

2. He would keep a record of the rates of pay for all employees engaged in construction, and the length of service of these employees.

[fol. 8018] 3. He would maintain records for the use of the Income Tax Section of the United States Treasury Department.

Assistant Pay Master:

In view of the magnitude of the work that would be required to reproduce the physical property of Lone Star Gas Company within a three year construction period, an assistant pay master would be required to assist the pay master in taking care of the details of the Payroll Division.

Machine Operator:

One machine operator would be required to make calculations and extensions for the Payroll Division.

Comptometer Operator:

One comptometer operator would be required to make calculations and check additions and extensions for the Payroll Division.

Typist:

In addition to the assistant pay master, two payroll and expense account clerks would be required to handle the detail work of the Division. One typist would also be required.

[fol. 8028]

General Organization Plan and Duties of the Section:

In the reproduction of Lone Star Gas Company, the Land Section would function without interruption and without change in personnel during the latter part of the Preliminary Development and Organization Period, the Pre-Construction Period and the Construction Period.

Upon the Land Section would devolve all work in connection with the acquisition of:

1. Fee lands.
2. Surface leases.
3. Mineral leases.

4. Gas purchase contracts.

5. Rights-of-way, easements, leases and road grants.

6. All miscellaneous contractual relations in any manner affecting lands, or interest in lands.

The Section would make thorough investigations of all acreage, producing and non-producing, within areas prescribed, and in areas adjacent thereto, and would determine the particular portion of such acreage that should be acquired, and would also determine the relative value of this acreage.

The Section would acquire and maintain records of all drilling operations in the prescribed areas, and in the areas immediately adjacent thereto.

The Section would prepare and put in general use standard forms covering scout reports, purchase orders, drafts, options, escrow agreements, executory contracts, division orders, transfer orders, gas purchase contracts, gas leases, and mineral deeds.

The Section would negotiate through brokers and with [fol. 8029] land owners for the acquisition of desirable developed and undeveloped acreage.

The Section would secure and compile for the Legal Section abstracts of titles.

The Section would determine the advisability of relenquishing leases where the prospect of profitable development would be doubtful, and would permit expirations that would be preferable to the expense of development.

The Section would, in connection with the Legal Section, see that releases were properly drawn, executed, and delivered to land owners.

The Section would, in connection with the Geological Section, determine the location of test wells.

The Section would initiate, draw, approve records, and handle for payment all vouchers issued in consideration for lands or interest in lands, and for any incidental expense incurred in connection therewith.

The Section would pay all rentals when due, issue vouchers to cover such payments, and maintain proper records thereof.

The Section would provide for and maintain a complete set of ready reference records.

The Section would set a system for and index and file all instruments and other papers affecting lands and matters pertaining thereto.

The Section would prepare and furnish statistics and other informatory communications to the Engineering Supervisor of Construction, Accounting, Geological and Executive Sections upon all matters pertaining to the Land Section.

[fol. 8030] Personnel Analysis:

In order that the duties of the Land Section might be economically performed, actual experience of Lone Star Gas Company has shown that the work systematically classified would be apportioned and placed under the direct supervision of division superintendents. These division superintendents would co-ordinate their work with and would be subject to the general direction of the Section manager, and for that purpose the personnel required would be as outlined in the following analysis.

Section Manager:

Upon the Section manager would devolve the duty of furnishing the contact between the Land Section and the Executive and Legal Sections of the general organization, the general direction of the operations of all divisions of the Land Section, and the final approval of all matters handled within this Section.

Necessarily a man to meet the requirements of this position would combine administrative and executive ability with a general knowledge of the natural gas business; a knowledge of so-called land laws, the rules peculiar to oil and gas mining leases and operations thereunder, and the regulations of the various State and other Commissions of those States in and through which Lone Star Gas Company would seek to produce, transport, purchase, distribute and sell natural gas; the ability to draw all instruments requisite to the proper acquisition of the land properties of the company and all operations incident thereto. He would also be able to make technical interpretations concerning these matters and have experience sufficient to determine their practical significance.

[fol. 8031] Stenographer:

In order to handle properly the writing of instruments and correspondence and miscellaneous files pertinent to the office of the Section manager, there would necessarily be employed a stenographer of sufficient ability and experience to take notes and transcribe accurately and in acceptable form technical and semi-technical instruments and general correspondence necessary to the conduct of the office.

Division of Records and Archives:

To this division of the Land Section there would be assigned the duty of installing and maintaining a system of classified ready reference records, indices and cross indices, and files for all instruments affecting the ownership of lands or interest in lands acquired by Lone Star Gas Company as well as all related correspondence.

As the conservation of Lone Star Gas Company's interest in its lands and the compliance with and enforcement of its contractual obligations attached thereto would be dependent upon these records, accuracy and specific knowledge of this phase of the natural gas business would be necessary.

In order to provide for and maintain records to meet these requirements would necessitate the employment of a personnel conversant with and experienced in the functions of the Land Sections of established oil or natural gas companies. Inasmuch as many matters handled by the Land Section would be closely associated with the functions of other Sections of the general organization, particularly the Legal, Engineering, Accounting and Geological Sections, the personnel employed in the Land Section would be required [fol. 8032] to have a general knowledge of the workings of these Sections.

Based upon the actual experience of Lone Star Gas Company, the personnel set out in the following analysis would be required in the Division of Records and Archives during the Pre-Construction and Construction Periods.

First Clerk:

To this clerk would be assigned the duty of maintaining general supervision over all other employees in the Divi-

sion, the distribution of work as classified, and the handling of all miscellaneous matters of this Division of the Land Section. Full knowledge of the work of the Division, and previous experience in similar work would be required of the first clerk.

Second and Third Clerks—Typists:

Upon these two clerks would devolve the work of abstracting, cross checking, and registering ready reference data from natural gas leases into ledgers provided for the purpose, compiling rental statements, drawing and mailing vouchers in payment of rentals, compiling reports and statistics pertaining to gas leases and the operations thereon. Previous experience in similar work would be required of the second and third clerks.

Fourth and Fifth Clerks—Typists:

Upon these two clerks would devolve the duty of abstracting, cross checking, and registering ready reference data from deeds, surface leases, miscellaneous contracts, rights-of-way grants, easements and licenses, construction claims paid, the drawing and mailing of vouchers in payment of rentals, compiling reports and statistics, and maintaining files.

[fol. 8033] Sixth Clerk:

The sixth clerk would be required for general utility work in connection with the care of files, blue prints and other records.

Stenographer:

The stenographer required for the Division would be experienced, accurate and capable of handling the varied assignments of dictation, forms of instruments, and the statistical data compiled.

Lease Division

Superintendent:

To the superintendent of this Division would be assigned the direct supervision of field forces employed in investigat-

ing, negotiating for, and acquiring prospective and producing gas properties; the maintenance of maps of properties of prospective and producing gas areas; meeting and dealing with lease brokers; handling correspondence and reports preliminary to the acquirement of leases, and maintaining the proper records thereof; and closing deals for leases, subject to the approval of the Section manager.

The requirements of this position would demand the services of a man with practical experience in field operations; a knowledge of the theory and functions of the Geological Section; a familiarity with and knowledge of the functions of the field forces of the Production Division. A man to meet the requirements could only be obtained from the organization of an established natural gas company.

Division Field Men:

Four division field men would be required, one for the West Texas area, one for the Panhandle area, one for Oklahoma, and one for South Central Texas. The division [fol. 8034] field man would report directly to the superintendent of the Lease Division.

Stenographer—Clerk:

A stenographer and clerk would necessarily be required in the office of the superintendent of the Lease Division and he should have sufficient experience to properly handle the correspondence, reports and files pertinent to the operations of the office and should be capable in the reading and spotting of maps maintained by the Division.

Right of Way and Construction Claims Division

Superintendent:

To the superintendent of this Division would be assigned the direct supervision over right-of-way men in the purchase of right--of-ways and settlement of construction damage claims; the acquisition of fee lands and miscellaneous surface leases necessary to the operation of the pipe line or Transportation Section; maintenance of proper records preliminary to the acquisition of rights-of-ways; settlement of damage claims; and the purchase of fee lands and

closing of surface leases, subject to the approval of the manager of the Land Section.

A man to properly fill the requirements of the position must have had practical experience in field work of the sort and a knowledge of the requirement and functions of the Transportation or Pipe Line Section of the system. A man of the caliber required would have to be obtained from the organization of an established natural gas company.

Stenographer—Clerk:

To the office of the superintendent of this Division would be assigned a stenographer and clerk of sufficient ability to [fol. 8035] handle the correspondence and files of this Division, render the reports required therefrom, and maintain all records preliminary to the closing of rights-of-ways and surface leases, and the settlement of construction claims.

Schedule of Salaries:

Position	Per Annum
Section manager	$9,000
Secretary	1,800
First Clerk—Division of Records	4,800
Second Clerk—Division of Records	2,400
Third Clerk—Division of Records	1,800
Fourth Clerk—Division of Records	1,800
Fifth Clerk—Division of Records	1,800
Sixth Clerk—Division of Records	1,800
Stenographer—Division of Records	1,500
Superintendent—Lease Division	4,800
West Texas Field Man	3,300
Panhandle Field Man	3,300
Oklahoma Field Man	3,300
South Central Texas Field Man	3,300
Clerk—Lease Division	1,800
Superintendent Right of Way Division	4,800
Clerk Right of Way Division	1,800
Total	$53,100

Defendant's Exhibit No. 28—Continued

Office Furniture and Fixtures as Per Detail Inventory:

Summary

Office of Sectional Manager of Land Department	$291
Office of Secretary to Sectional Manager of Land Department	946
Office of Superintendent of Lease Division	232
Office of Secretary to Superintendent of Lease Division	299
Office of Superintendent of Right-of-way Division	137
Office of Secretary to Superintendent of Right-of-way Division	299
Office of Chief Clerk of Land and Lease Department	233
Office of Secretary and Assistants to Chief Clerk of Land and Lease Department	5,091
Total	$7,528

[fol. 8036] Stationery and Office Supplies:

Pre-Construction Period	$1,270
First Construction Year	2,206
Second Construction Year	2,206
Third Construction Year	2,206

Transportation Expense:

It would be necessary for the superintendent of the Lease Division, the superintendent of the Rights-of-way and Construction Claims Division, and the four Division field men to have automotive equipment for efficient discharge of their duties.

The estimated annual cost of transportation expense is as follows:

2 cars at $1,250 each—$2,500 Depreciation at 25 per cent	$625
4 cars at $650 each—$2,600 Depreciation at 33 per cent	867
2 cars 36,000 miles at 5 cents per mile	1,800
4 cars 144,000 miles at 5 cents per mile	7,200
Total	$10,492

Defendant's Exhibit No. 28—Continued

Traveling Expense:

It is estimated that the two superintendents would be in the field at least one-half the time, and that the Division field men would be continuously in the field. Upon this basis, the annual cost would be as follows:

Superintendents 360 days at $5.00 per day	$1,800
Division Field men 1,460 days at $4.00 per day	5,840
Total	$7,640

Communication Expense:

In addition to the cost of office phones, the General Office would be in daily communication with the field men engaged in lease and rights-of-way activities. The estimated annual [fols. 8037-8038] cost for communication is as follows:

	Per Annum
Telegrams and Tolls, $450.00 per month	$5,400
Telephones 4 at $6.60 each, $26.40 per month	317
Total	$5,717

Floor Space Requirements:

The minimum floor space requirements for the Section would be 1,800 square feet.

Division of Expense by Periods:

The personnel of the Land Division and the Lease Division would be engaged six months prior to the beginning of construction. The superintendent of rights-of-way and his clerk would be engaged three months prior to the beginning of construction. Salaries, transportation, and traveling expenses have been allocated on this basis.

[fol. 8041] Geological Section

Under the discussion of Preliminary Development and Organization Costs, the personnel and duties of the geological organization that would be required to reproduce the geological information and records in possession of Lone Star Gas Company as of January 1, 1933, within a four year period, were analyzed and the proportionate cost attributable to the development period set up as a part of the preliminary development costs.

In this phase of the analysis, it was estimated that this geological organization would begin to function immediately upon the completion of the preliminary geological report, and that the time involved as a preliminary charge would be one year which period would carry the geological work up to the date of the incorporation of the company.

The work of the Geological Section would have no direct relation to the construction of the physical plant of Lone Star Gas Company (except gas well construction) and for this reason, it has been assumed that the work of the Geological Section would continue without modification in personnel or general duties until the present geological records of the company would be reproduced. With the personnel set up for the preliminary period, it is estimated

that three years from the date of incorporation would be the minimum time required for this work.

This assumption would result in the substantial completion of the geological work necessary for the reproduction of information and records by a date which would be six months in advance of the estimated completion date of the physical property. At this time there would necessarily be a reduction in the personnel of the Geological Section [fol. 8042] in order to conform to the reduction of duties, which for the last six months of construction, would be confined to routine office work and the field work in connection with the location of the last group of gas wells, and the investigation of new acreage not actually in possession of the company as of January 1, 1933.

In connection with this estimate of geological costs from the date of incorporation to a date six months in advance of the completion of construction, a three year period, it will be unnecessary to set out in detail the scope of the work that would be done, or the duties of the various individuals that would be engaged for the reason that these details have been fully covered in the analysis of Preliminary Development Costs, and as above stated, for the reason that there would be no material modification in the work done, nor in the personnel engaged during the three year period following incorporation.

The item of office rent for the general office force has been eliminated for the reason that it has been assumed that the general office building of the company would be acquired at incorporation, and the cost of this building representing rent has been included as an undistributed cost.

Estimate of Cost—Three Year Period

[fol. 8055] Purchasing Section

General Organization Plan and Duties of the Section:

The Purchasing Section is that Section of the general organization that would be responsible for the securing of satisfactory materials and supplies at the cheapest prices available, quality of merchandise considered for the general office, for construction, and for other departments in the reproduction of Lone Star Gas Company. The Purchasing Section would also be responsible for the delivery of materials and supplies to the various departments in advance of the time set for their actual use. Through the proper functioning of this department delays and attendant unnecessary expenses in *in* construction costs would be eliminated.

In its general functions, the Purchasing Section would be strictly a material and supply department. The purchasing agent and the employees would receive, check, and pass for payment all invoices, negotiate all contracts and agreements covering the purchase of materials and supplies, maintain complete records of all purchases, and furnish reports to the general manager and department heads.

In the reproduction of Lone Star Gas Company, following the actual organization plan of this company when in construction and operation, the head of this section would be the purchasing agent who would report directly to the general manager, and who would also be in close contact with all other department heads in the organization.

Under the general supervision of the purchasing agent would be the Purchasing Department, Stores Department, the Traffic Department, and the Stationery Department. The Stores Department would be under the direct super- [fol. 8056] vision of the supervisor of Stores, the Traffic Department under the direct supervision of the traffic manager, and the Stationery Department under the direct supervision of an assistant purchasing agent.

Purchasing Department

Summary of Salaries and Expenses

Salaries:		
Pre-Construction period	$14,400	
Construction period	146,700	
Post-Construction Period	13,125	
		$174,225
Office Furniture and Fixtures:		
Depreciation based on total cost of $7,001 as shown by detailed inventory		1,960
Stationery and Supplies:		
Pre-Construction period	450	
Construction period	12,967	
Post-Construction period	150	
		13,567

Defendant's Exhibit No. 28—Continued

Transportation:		
Two automobiles	$2,444	
Operating cost	5,520	
		$7,964
Traveling Expenses:		
Purchasing agent	7,200	
Assistant purchasing agent	2,000	
		9,200
Communication:		
Telephone exchange service	3,802	
Telephone tolls	4,800	
		8,602
Telegraph tolls		2,400
Total		$217,918

(NOTE.) Office rent is included under Undistributed General Costs. The estimated net floor space that would be required for the Purchasing Department is 3,100 square feet.

Personnel Analysis:

In developing an organization for a Purchasing Department that would be responsible for the purchase, receipt [fol. 8057] and distribution of the material and supplies that would be required for the reproduction of Lone Star Gas Company as of January 1, 1933, within a three year construction period, several basic factors must be considered.

1. That the value of the material that would be used in reproduction would be approximately $30,000,000.

2. That the Construction Department would be continuously engaged under peak conditions throughout the construction period.

3. That several distinct classes of construction would be proceeding simultaneously and at different locations on the system as:

(a) Laying pipe and drilling wells.
(b) Building compressor stations, measuring and regulator stations.
(c) Constructing telephone lines.
(d) Building river crossings.
(e) Laying gathering and well lines.

Due to the speed with which this work would be done, and the mass of details that would be involved in its satisfactory completion, a thoroughly experienced Purchasing Department would be required, and none but experienced employees with the exception of some engaged in minor capacities, could be used.

It would be necessary to begin the organization of the Purchasing Department immediately upon the completion of corporate organization, and the engagement of the engineering personnel, as the following materials and supplies would be needed.

Field equipment for surveying crews.
Office furniture and fixtures.
Stationery and office supplies.

It has been assumed that this date would be six months in advance of the beginning of actual construction. At the beginning of the six months pre-construction period, the department would have the following personnel:

Purchasing agent.
Assistant purchasing agent.
Chief Clerk.
Stenographer.

[fol. 8058] The qualifications and duties of these employees would be as follows:

Purchasing Agent:

It would be necessary to secure a man with proper qualifications for this work from the organization of some other company engaged in similar activities, as his work would require a thorough knowledge of the materials and supplies that would be used in the construction of Lone Star Gas Company. It would not be necessary for him to have had practical construction experience provided his previous

purchasing experience had been secured on the construction of a major gas system. His general duties would consist of the responsible direction and supervision of the Purchasing, Stores, Traffic, and Stationery Departments. He would negotiate all contracts and agreements, confer with the general manager and department heads, and direct the departmental work.

Assistant Purchasing Agent:

The assistant purchasing agent should have a thorough familiarity with the classes and values of office furniture, equipment and supplies, and should have a knowledge of paper stocks and printing methods. He should also have executive ability, as he would be placed in charge of the Stationery Department. His immediate duties would be the purchase of the necessary furniture, supplies, stationery, and printed forms needed by the Engineering and Purchasing Departments. His other duties would consist of the setting up and maintenance of proper price and stock records, the compilation and furnishing of necessary reports of issues required for accounting purposes, the interviewing of salesmen, and the maintenance of interdepartmental contacts.

[fol. 8059] (NOTE.) The salary and expenses of the assistant purchasing agent have been included under the cost of the Stationery Department.

Chief Clerk:

The chief clerk would, of necessity, be a man thoroughly trained and experienced in the gas and oil industry material supply markets and prices. He would also have executive qualifications, as he would have direct supervision of the detail division of the department, and would assist the purchasing agent in the selection of the clerical personnel for the department.

Stenographer:

The stenographer should be a man experienced in stenographic work, and should be familiar with the terms, both catalog and field, used in describing the material that would be used in the construction work. His duties would be the handling of all correspondence for the purchasing agent,

assistant purchasing agent, and chief clerk and the typing of all orders from requisitions, for the office, and for material and supplies required by the field forces of the Engineering Department. After the complete department is organized, this stenographer would have direct supervision over the stenographers required to write orders, and would personally check all orders with the requisitions. He would also act as secretary to the purchasing agent and assistant purchasing agents, other than the assistant purchasing agent in charge of the Stationery Department.

At this time, it would also be necessary for the purchasing agent to begin the organization of the Stores and Traffic Departments. A thoroughly capable supervisor of stores and a traffic manager would have to be secured. Care should be exercised in the choice of these two men, [fol. 8060] and they should have highest qualifications as considerable economy to the company would result in securing men for these two positions who would be able to build efficient departments capable of handling the large amount of work that would begin immediately after the organization of the departments.

The Engineering Department would begin furnishing the Purchasing Department with specifications for construction equipment, material and supplies from three to four months in advance of the date set for starting actual construction. The Purchasing Department would at this time begin the assembly of a complete list of manufacturers and jobbers who would be able to furnish material and supplies for the construction program. The Purchasing Department would begin the preparation of inquires from specifications furnished by the Engineering Department.

Within two months after the beginning of the six months pre-construction period, the following employees would be added:

Assistant purchasing agent.
Assistant purchasing agent.
Price Clerk.
Price Clerk.
Stenographer.
Typist.
Typist.

The duties of these added employees would be as follows:

Assistant Purchasing Agent:

This assistant purchasing agent would be the purchasing agent's first assistant and would have supervision of the department. He would interview salesmen and relieve the purchasing agent of the overflow from his desk. He would sign all orders when the purchasing agent was absent, and handle purchases for pipe and machinery, as well as other major items used in the construction. He should be familiar with the material and supplies needed, and be an experienced purchasing agent.

[fol. 8061] Assistant Purchasing Agent:

This assistant purchasing agent also should have had previous experience in a Purchasing Department of a natural gas pipe line company as he would purchase all the hand tools and fittings required for this work. He would interview salesmen. He would also check all orders against requisitions before they would be passed to the purchasing agent for signing.

Price Clerks:

The qualifications of two price clerks would require that they have a thorough knowledge of the work they would be called upon to perform and be able to understand the specifications of materials and the purpose for which these materials would be required. They would prepare inquires from requisitions received from the Engineering Department, and request quotations from the various companies that could furnish the material needed. They would set up and maintain quotations and price records; check requisitions before placing orders, and inform purchase order clerks as to the sources of supply; check prices on all invoices, and handle correspondence with reference to credit memoranda covering incorrect prices. They would also handle other correspondence in connection with quotations, catalogs, prices, trade and cash discounts. They would make card-index records of cash discounts, and stamp all invoices with dates discounts would be due; keep necessary records of purchases on contracts, blanket orders, etc., and keep the purchasing agent informed as to the status of contracts, agreements, and blanket orders, prices, transfers, estimates, and inventories.

Stenographer:

This stenographer should have had previous experience [fol. 8062] in similar work, and should be thoroughly capable and efficient. He would handle all stenographic work for the chief clerk and price clerks.

Typist:

This clerk should be thoroughly capable and experienced and be familiar with terms, names, and general specifications of materials that would be used in this work. He would type lists of materials and specifications prepared by the price clerks for quotations. When required, he would be transferred to the duties of tracing clerk.

Typist:

This clerk should be thoroughly capable and experienced, and familiar with terms, names, and general specifications of materials that would be used in this work. He would also assist the other typist and would type purchase orders. Later he would be transferred to the duties of purchase order clerk.

Within four months after the beginning of the six-month pre-construction period, the following employees would be required:

Purchase order clerk.
Purchase order clerk.
Stenographer.
Purchase order invoice clerk.
Field order invoice clerk.
Pipe order clerk.

whose duties would be as follows:

Purchase Order Clerks:

These two clerks should be capable and efficient typists and thoroughly familiar with classes of materials that would be used in this work. They would be under the supervision of the head stenographer, and it would be their duties to assign purchase order numbers to requisitions, to keep proper register and index of purchase orders, and to type purchase orders from requisitions, to assist in checking orders against requisitions, and to file requisitions, and the typist already

[fol. 8063] in the organization and referred to above would be transferred to one of these jobs.

Stenographer:

This stenographer should be thoroughly capable and efficient and experienced in this line of work. He would handle stenographic work and typing in detail for the division, file correspondence, and assist other clerks.

Purchase Order Invoice Clerk:

This clerk should have had previous experience in similar work, and should be familiar with requirements and proceedures of the Accounting and Stores Departments. He should also be familiar with the various kinds of materials required, and the purposes for which this material would be used. He would handle purchase orders (except those assigned to pipe order clerk); set up and keep proper file of open purchase orders; match invoices and material received reports; check quantities and specifications on invoices against orders and material received reports; trace storekeepers for material received reports; trace shippers for invoices and shipping papers. He would also handle correspondence regarding shortages, return of incorrect and defective materials, and credit memoranda covering and furnish the Traffic Department with necessary papers and data for filing claims for loss and damage.

Field Order Clerk:

A clerk for this job should have had previous experience in this class of work. He should be familiar with Accounting and Stores Department procedure, and field activities and requirements. He would register and file field orders; trace field men for orders; trace vendors for invoices; match [fol. 8064] and check invoices with orders; handle correspondence regarding discrepancies in invoices and orders, and credit memoranda covering invoice shortages and materials returned.

Pipe Order Clerk:

The pipe order clerk should be a man having a wide experience in the handling of orders for pipe and other kindred materials that would be used in the work, and should be thoroughly familiar with all such materials. He should

understand Accounting and Stores Department procedure, and should be familiar with gas pipe line construction work. He would check all requisitions for carload shipments of pipe; place orders to cover, keep complete record of all such orders; arrange pipe shipping schedules, and trace mills for shipping information. He would furnish shipping notices to the Stores, Traffic, Engineering and Pipe Line Departments; check invoices as to quantities and prices; match invoices with material received reports; check mill tallies and storekeeper's tallies. He would also handle all requisitions, orders, shipping notices, material received reports, and invoices covering pipe line paint, oxygen, acetylene, carbide, and welding rod; set up and maintain complete field and records; handle correspondence in connection with the above, and furnish the Traffic Department necessary papers for filing loss and damage claims.

At the end of the six-month pre-construction period, the following additional employees would be required to complete the organization and carry on the work of the department during the three-year construction period.

Tracing Clerk.
Drum record clerk.
Purchase order invoice clerk.
Field order invoice clerk.
Stenographer.
File clerk.

[fol. 8065] Tracing Clerk:

The typist already employed and referred to above would be transferred to this job. His duties would be to set up and maintain open file on all tracing copies of purchase orders (except those handled by pipe order clerk); check acknowledgements against orders; make record of shipping dates, and notify department heads and field men when shipments would be made, how shipped, routing, and approximate date of delivery. He would also trace shippers on all open orders at regular intervals; check all weekly reports of open purchase orders from the field, and advise field men with reference to the status of all open orders reported by them. This clerk would also be a typist and would handle all correspondence in connection with this desk.

2747

Drum Record Clerk:

The drum record clerk should be experienced in work of a similar nature. His duties would be the setting up and maintenance of card-index or ledger record of all oxygen and acetylene cylinders received and returned; also, all other returnable containers, including electric wire and cable reels, and he would also handle transfers of full drums from one point to another; check semi-monthly drum reports; keep complete file records of all transfers and reports of empty cylinders returned; check drum reports from vendors and furnish them with reports of drums outstanding at regular intervals.

Purchase Order Invoice Clerk:

This clerk should have had previous experience in similar work, and should be familiar with requirements and procedures of the Accounting and Stores Departments. He should also be familiar with the various kinds of materials required, and the purposes for which used. He would han- [fol. 8066] dle purchase orders (except those assigned to pipe order clerk); set up and keep proper file of open purchase orders; match invoices and material received reports, check quantities and specifications on incoices against orders and material received reports; trace storekeepers for material received reports; trace shippers for invoices and shipping papers. He would also handle correspondence regarding shortages, return of incorrect and defective materials, and credit memoranda covering; furnish Traffic Department with necessary papers and data for filing claims for loss and damage.

Field Order and Invoice Clerk:

A clerk for this job should be capable and efficient, and have had previous experience in this class of work. He should be familiar with Accounting and Stores Department procedure, and field activities and requirements. He would register and file field orders; trace field men for orders; trace vendors for invoices; match and check invoices with orders; handle correspondence regarding discrepancies in invoices and orders, and credit memoranda covering invoice shortages and materials returned.

Stenographer:

This stenographer should have had previous experience in similar work, and should be thoroughly capable and efficient. He would handle all overflow stenographic work for the chief clerk and price clerks as the volume of their work would be increased to such an extent after the beginning of actual construction that an additional stenographer would be necessary. He would also handle correspondence and details from the price order clerk.

[fol. 8067] File Clerk:

This file clerk should be capable, efficient, and experienced in filing. His duties would be the opening, stamping, and distributing of all incoming mail; the collection and mailing of all outgoing mail; the distributing files and correspondence between desks in the department; the preparing and filing of all purchase orders. He would also pull and deliver closed orders from files when called for and keep record of all "out" orders and see that they are returned to the files. He would keep a daily record of the number of invoices received and passed, and the number of pieces of correspondence handled in and out, and also run errands.

Schedule of Salaries

Pre-construction Period:

Position	Months	Rate	Total
Purchasing agent	6	$700	$4,200

Total			$13,125

Defendant's Exhibit No. 28—Continued

Summary

Pre-construction period—6 months	$14,050
Three year construction period $48,900 per year	146,700
Post-construction period—6 months	13,125
Total Four Years	$173,875

[fol. 8069] Reduction of Personnel

Personnel at End of Three Year Construction Period.

Purchasing agent	Stenographer
Assistant purchasing agent	Stenographer
Chief clerk	Purchase order invoice clerk
Price clerk	Field order invoice clerk
Secretary to purchasing agent	Drum record clerk
File clerk	

Personnel Three Months After Construction is Completed:

Purchasing agent
Assistant purchasing agent
Chief clerk
Secretary to purchasing agent
Stenographer
File clerk

The above force would be required for an additional three months only which would be six months after construction is completed, at which time all employees would assume operating duties of the department.

Stationery and Office Supplies

During the year 1931, the stationery and office supply requirements of the Purchasing Department of Lone Star Gas Company amounted to $1,695.83. During this period the amount of purchases handled was comparatively small as the company was in operation only. It is, therefore, considered that a conservative estimate for the purpose of this report would be twice the cost for 1931, or three thousand three hundred ninety one dollars and sixty six cents per year, and upon this basis the estimate follows:

Defendant's Exhibit No. 28—Continued

Pre-construction period—6 months	$450.00
Construction period—3 years	12,966.64
Post-construction period—6 months	150.00
Total	$13,566.64

Transportation

It would be necessary for the purchasing agent and his first assistant to make frequent trips over the system dur- [fol. 8070] ing the four years this department would be engaged in work in connection with the construction program. Therefore, for this purpose, the following automotive equipment would be required:

One Chrysler standard sedan	$1,746.50
One Chevrolet standard sedan	697.50
Total	$2,444.00

It is assumed that these automobiles would be practically worn out at the end of the four years, therefore, no salvage has been allowed.

Automobile Operating Expense

It has been estimated that during the period of construction, the Chrysler automobile would travel approximately 18,000 miles per year, and the Chevrolet approximately 12,000 miles per year, or a total of 120,000 miles, cost of operation being as follows:

Chrysler—72,000 miles at $.05 per mile	$3,600.00
Chevrolet—48,000 miles at $.04 per mile	1,920.00
Total	$5,520.00

(Note.) The Automotive Section advises that over a period of four years, operating costs of a Chrysler would average around $.045 to $.05 per mile, and around $.035 to $.04 per mile on a Chevrolet.

Traveling Expenses

During the period of construction, it would be necessary for the purchasing agent to make a number of trips to East-

ern pipe mills and other supply sources, and to make frequent trips over the system. It is estimated that his expenses for this purpose over the entire period would average approximately one hundred and fifty dollars per month.

Total: Four years at $1,800.00 per year $7,200.00

[fols. 8071-8072] It would also be necessary for the first assistant purchasing agent to make frequent trips of inspection to the various locations where materials would be delivered, and it is estimated his traveling expenses would average approximately five hundred dollars per —.

Total: Four years at $500.00 per year $2,000.00

Communication

The following expenses for telephone exchange service and telephone and telegraph tolls would be incurred in view of the fact that a great amount of such communication would be necessary in connection with the ordering, shipping and delivery of the necessary equipment, materials and supplies. Therefore, basing this on the present service charge per phone, it is estimated that the following expenses would be incurred:

12 Telephones at $6.60 each per month	$3,801.60
Telephone tolls $100.00 per month (Estimated)	4,800.00
Telegraph tolls $50.00 per month (Estimated)	2,400.00
Total	$11,001.60

[fol. 8073] Stores Department

Summary of Salaries and Expenses

Salaries:		
Pre-construction period	$7,635	
Construction period	119,695	
Post-construction period	21,870	
		$149,200
Office Furniture and Fixtures:

Construction period	16,923	
Post-construction period	2,821	
		21,155
Total		$225,690

(Note.) Office rent is included under Undistributed General Costs. The estimated net floor space that would be required for the Stores Department is 2,600 square feet.

Duties of the Department and Personnel Analysis

In the reproduction of Lone Star Gas Company, the Stores Department would be organized about ninety days before actual construction would begin, and in this connection, the general office personnel, which would consist of the following employees, would be actively engaged at the beginning of the construction period.

[fol. 8074] Supervisor of stores.
Stenographer.
Assistant supervisor of stores.

Stenographer.
Chief Clerk.
Voucher clerk.
Two invoice clerks.
Combination stenographer and comptometer operator.
Surplus clerk.
Price clerk.
Two combination stock clerks and machine operators.
Two comptometer operators.
Two stenographers.
Field supervisor.
Two inventory field men.
Progress report clerk.
Combination stenographer and comptometer operator.

This personnel which would comprise the departmental organization at the end of the pre-construction period would be amplified as the actual construction progressed.

As soon as material would be ordered for the various lines, compressor stations and other elements of the construction program, the Stores Department field men would furnish routings and destination points to the Purchasing Department. Pipe yards would be rented, and temporary warehouses secured in which to house and protect material items which would be delivered in advance of construction.

A large amount of preliminary work would be required of the department in connection with estimates for the automotive equipment that would be required for the unloading, hauling, and transfer of material inasmuch as the department would be directly responsible for the delivery of all materials of construction.

While not a part of the cost of General Stores to which this estimate has been confined, a knowledge of the activities of the Field Stores Division of the department the cost of which is included in the estimate of direct structural costs is necessary for a clear concept of the part that the Stores Department would play in the reproduction program.

[fol. 8075] As material would be ordered for pipe lines, drilling wells, compressor stations and other elements of the property, it would be necessary to employ divisional storekeepers and warehousemen. It would be the duty of the storekeepers to keep the supervision of the Construction Department fully advised as to the receipt of material, and be responsible for the following:

1. The receipt and issuance of all material.

2. The uncrating and storing of all material.

3. The unloading and tallying of pipe when received.

4. The checking of material against purchase orders.

5. The payment of all freight and express charges.

6. The origination of all claims for damages and shortages.

7. The draying of material to and from warehouses.

8. The keeping up with material used on completion reports.

9. The keeping of drum records for oxygen and acetylene drums.

10. Locating where material is to be used by account numbers.

11. The purchasing of emergency material needed by the Construction department.

12. The issuance of material received reports, storehouse requisitions, and transfers.

13. The origination of purchase requisitions for material needed in construction.

14. The tallying of pipe on various lines constructed and other similar details.

All records and supervision in connection with the above field work would be kept and maintained by the General Stores Division.

It would be necessary for the Stores Department to have constant and close contacts with the Purchasing Department, the Rights-of-way Department, the Engineering Department, and the Construction Department for the purpose of securing prompt delivery of material and the pre- [fol. 8076] vention of the delivery of defective material or material unsuited for specific purposes. It would also be necessary for the Stores Department to provide for the vouchering of all invoices, the registering of invoices, and the listing of all invoices by voucher number.

After warehouses had been located for the construction of compressor stations and for field work, stock records

would be set up in the general office in order to maintain a record of material used on the various accounts. After the construction work had progressed and some of the stations and lines had been completed, it would be necessary to add to the general office force a surplus material clerk whose duties will be developed in the subsequent discussion.

Supervisor of Stores

In the reproduction of Lone Star Gas Company, the duties of the supervisor of stores would be so numerous and varied that in order to properly discharge these duties he should have a thorough knowledge of all materials which he would be called upon to handle, and of the purpose for which they would be used. He should also thoroughly understand the principles of accounting in order to furnish correct distribution for material received, or used out of his warehouses. He would act in a supervisory capacity, seeing that materials would be unloaded promptly and that pipe would be strung satisfactorily on pipe lines; that warehouse stocks would be kept up and pipe properly checked as it would be delivered to the job. He should see to the payment of invoices, the filing of claims and many other details which would come up during a construction period of this length of time, and on a construction program of this magnitude.

In order to secure a man with these qualifications, it [fol. 8077] would be necessary to secure him from some supply house or preferably, from some other natural gas company.

Stenographer for Supervisor of Stores:

It would be necessary for a stenographer for this position to have had experience with a supply house and to be thoroughly familiar with pipe and fittings, as well as with filing.

Assistant Supervisor of Stores:

The assistant supervisor of stores would be required to have practically the same general knowledge as the supervisor of stores. He would take care of the overflow of details. He should also be familiar with all classes of material and accounting procedure, as he would be respon-

sible for the reports on receipt of material, transfers covering material used, and the account numbers on which the material would be used. It would be his duty to see that the general office would function properly; that payment of invoices would be made promptly in order to secure discounts; to keep up with the construction work in the field, and to see that the field storekeepers were taking care of their work in a proper manner.

In order to secure a man of the above qualifications, it would be necessary to secure him from some supply house or gas company.

Stenographer for Assistant Supervisor of Stores:

It would be necessary for a stenographer for this position to have had experience with a supply house and to be thoroughly familiar with pipe and fittings, as well as with filing.

Chief Clerk:

The chief clerk's duties would be the supervision of all of the work of the clerks in the Stores Department, to see that the invoices were paid promptly and properly entered [fol. 8078] on stock records; that transfers were priced and entered on stock records, and to supervise the handling of material transfer orders and material records. It would also be his duty to handle office correspondence and to see that the department functioned properly.

To secure the services of a man of the above experience, it would be necessary that he be secured from a supply house or another gas company.

Voucher Clerk:

The duties of the voucher clerk would be to voucher all invoices with voucher checks and to keep an invoice register showing the date paid and the voucher number covering, and to see that all invoices were paid promptly in order to take advantage of cash discounts.

Invoice Clerks:

After construction work is fully started, it would be necessary to have two additional invoice clerks who would assist the voucher clerk in the paying of invoices and the checking

of the invoice register by showing the voucher numbers and dates paid, as well as to see that all invoices were paid in time to take advantage of cash discounts.

Surplus Material Clerk:

As all purchase requisitions would be passed to the Stores Department, it would be the function of the surplus material clerk to keep informed relative to any surplus material from pipe line, compressor station, and other construction for the purpose of furnishing material for construction from surplus stock rather than by the purchase of new material. This clerk would be one of the most important employees in the department. A failure on his part to properly discharge his duties would result in an accumulation of surplus [fol. 8079] material in warehouses with corresponding losses resulting therefrom. A thorough knowledge of materials of construction would be required as a qualification of this clerk.

Combination Stenographer and Comptometer Operator:

It would be necessary to have a combination stenographer and comptometer operator in the invoice department, preferably someone who had had experience with a supply house or a gas company. He would check discounts and prices on invoices and tally sheets, and write letters regarding statements and other office details.

Price Clerk:

It would be the duty of the price clerk to price all transfers and material received reports and to see that they would be properly entered on the stock records. This man should be familiar with all classes of material. He should also be familiar with accounting procedure of the company, and it would be his duty to see that transfers would be properly priced.

In order to secure a man of this experience it would be necessary to secure him from some supply house.

Stock Record Clerks and Machine Operators;

It would be the duty of the stock record clerks to keep the stock records up to date, handle all material, receive reports with invoices, and enter the stock records; handle all trans-

fers in and out of the respective warehouses and to be familiar with the operation of a Burroughs Posting Machine and a Moon Hopkins Machine in order to handle these transfers. He would keep the stock records up to date, and take off monthly balances for the Stores Department statement of material on hand. These clerks should be familiar with material of all kinds, keep themselves posted in prices [fol. 8080] and also see that transfers were handled properly.

Comptometer Operators:

It will be necessary after construction work advances to have two comptometer operators for the extension of material received reports, prices of material and the checking of transfers, invoices and pipe tallies.

Stenographers:

It would be necessary to have two stenographers in this department after material begins to arrive to write letters on material which has been damaged or is short in shipment, or any other letters for anyone under the chief clerk. They should also be thoroughly familiar with filing and receive all mail for this department.

Field Material Supervisor:

This man should be familiar with all classes of material and should keep up with all construction work, oversee the pipe stringing foreman, see that the pipe as well as other material were handled properly. He would have to be a good organizer, as the inventory men and district storekeepers, as well as the storekeepers would be under his general supervision during the construction period. He would be in the field practically all the time in direct connection with all of the work that would be going on. He should be able to line up all storekeepers in the field as to the proper procedure in handling Stores Department records. He would report daily to the supervisor of stores or his assistants on various matters pertaining to construction. In order to obtain a man with these qualifications it would be necessary to secure him from some supply company or gas company.

[fol. 8081] Inventory Men:

After construction work has made some progress and various stations have been completed, it would be necessary to have inventory men close out the expenditure requisitions and take inventories of material that would be left over from construction. These inventory men should thoroughly understand all classes of material, and the general routine of stores work and also be familiar with accounting procedure. They should be able to advise and instruct the storekeepers and warehousemen with whom they might come in contact. They would also furnish routing and destination points for the delivery of material, and report to the field material supervisor. To secure two men for this work, it would be necessary to get them from a supply house or some other gas company.

Progress Report Clerk:

It would be necessary when construction began to have a progress report clerk who would check progress reports on pipe received and other material, showing how much pipe had been strung each day and the general progress made during construction. This man should be familiar with all the field operations and the location of the work, as he would be required to work in connection with the field material supervisor in regard to the handling of trucks and truck drivers. He would also have to keep in touch with all the gangs that might be working each day.

Combination Stenographer and Comptometer Operator:

It would be necessary to have a stenographer in the inventory department for the filing and writing of letters. During the first year of construction a combination stenographer and comptometer operator would suffice for this work. After [fol. 8082] construction had progressed a comptometer operation in addition to the stenographer would be required.

Defendant's Exhibit No. 28—Continued

Schedule of Salaries

Position	Monthly Rate	Annual Total
Supervisor of stores	$450	$5,400
Assistant supervisor of stores	250	3,000
Chief clerk	200	2,400
Stenographer	125	1,500
Stenographer	115	1,380
Voucher clerk	175	2,100
Invoice clerk	125	1,500
Invoice clerk	125	1,500
Stenographer and comptometer operator	125	1,500
Surplus material clerk	165	1,980
Price clerk	135	1,620
Stock record clerks and machine operators (Each)	125	1,500
Comptometer operators (Each)	115	1,380
Stenographers (Each)	100	1,200
Field material supervisor	200	2,400
Inventory men (Each)	175	2,100
Progress report clerk	150	1,800
Comptometer operator and stenographer	100	1,200

Stationery and Office Supplies

Based upon the past experience of the department in construction, it is estimated that requirements for stationery and supplies would cost $12,500.

Total $12,500

Transportation

Four automobiles would be required for employees of the office who would have general supervision of work in the field. These automobiles would cost $2,963 and would lose their entire value during the progress of the work.

Total $2,963

Traveling Expenses

Traveling expenses of the supervisor and inventory men. [fols. 8083-8084] As previously developed, the Stores De-

partment would be responsible for the routing and destination of pipe and equipment, the rent of temporary warehouses, the unloading and stringing of pipe, and other field operations. At least four men from the department would be traveling a major portion of time involved in construction. The expenses of these men have been estimated at $21,350.

Total $21,350

Communication

Long distance tolls, telegrams and telephones. Due to the fact that the company lines would not be built in advance of construction, the Stores Department would incur large expenditures on account of long distance tolls. These calls would become less during the progress of construction on account of the partial completion of the company system. It is estimated that the cost of tolls for the pre-construction and construction periods would be $15,000.

Total $15,000

The charges for telegrams during the pre-construction and construction periods would necessarily be large. This estimate has been based upon the actual expenditures for the department during periods in which a large amount of construction work was current. The estimated amount has been placed at $5,000.

Total $5,000

For the office force of the department to function properly, eight telephones at a cost of $27.50 would be required for the period, or a total outlay of $1,155.

Total $1,155

[fol. 8085] Stationery Department

Summary of Salaries and Expenses

Salaries:		
Pre-Construction period	$6,820	
Construction period	45,540	
Post-Construction period		
		$52,360

Defendant's Exhibit No. 28—Continued

Office Furniture and Fixtures:		
Depreciation based on total cost of $6,888 as shown by detailed inventory		$1,975

Communication:		
Telephone exchange service	$1,529	
Dictograph installation	700	
Telephone tolls	1,470	
Telegraph tolls	630	
		4,329
Total		$61,482

(Note) Office rent is included under Undistributed General Costs. The estimated net floor space that would be required for the Stationery Department is 3,062 square feet.

Duties of the Department and Personnel Analysis:

This department would report directly to the Purchasing Agent.

The duties of this department would be to promptly furnish the general and field offices with all office furniture and equipment, properly maintain this equipment, and supply all offices with printing, stationery, office, and janitor's supplies. This department would be responsible for the maintenance of sufficient stock at all times. It would prop- [fol. 8086] erly receipt, disburse, and account for this stock, and assist in the standardization of office equipment, furniture, printed forms, and supplies for the purpose of economy and practicability.

In the reproduction of Lone Star Gas Company, this department would function from the beginning of organization or six months prior to actual construction, and would require at the outset a suitable department head and four experienced clerks, as follows:

Chief clerk.
Secretary and order clerk.
Stock record and disbursement clerk.
Multigraph and mimeograph operator.

As the organization man-power increased it would be necessary to increase the Stationery Department force by the employment of an additional multigraph operator, a disbursement clerk and, when the field foremen and storekeepers were about 50% organized, a shipping clerk. The department would be complete at least sixty days prior to actual construction.

Assistant Purchasing Agent:

The assistant purchasing agent should be a man of experience in accounting, selling and purchasing, and should be thoroughly familiar with classes and values of office furniture, equipment and supplies. He should also have a knowledge of paper stocks and printing methods and be capable of contacting the public as well as the department heads of the organization. His specific duties would be:

The selection of suitable department personnel.
The purchasing of office supplies and equipment.
The surveying of sources of supply, furniture and equipment houses, printing and lithographing establishments.
[fol. 8087] The supervision of department work.
The assisting of all departments in selection of proper stocks, sizes and binding or filing methods for all forms and suitability of various grades of supplies and determining the maximum and minimum required of such items.
The making of contracts for purchases of such equipment or service as should be contracted for.
The interviewing of sales representatives.
The accounting for disbursements.
The handling of correspondence.

Chief Clerk:

The chief clerk should have a thorough knowledge of general office and stock handling procedure and he should be an experienced office supply man. His specific duties would be:

The assisting of the department head in various duties.

The maintaining of records on brief cases, typewriters, furniture, statements and shipments.

The checking of all orders, invoices, statements and shipments.

The keeping current of all price lists and catalogues.

The transferring of surplus equipment and supplies from points where not in use to points where needed.

The making up of requisitions for stock items.

The promotion of a feeling of friendliness between employees of this and other departments.

The checking of multigraph shop job tickets and estimating the savings effected by that department.

The handling of correspondence.

Secretary and Order Clerk:

A secretary and order clerk should be experienced in secretarial and general office work and have a knowledge of purchasing procedure. His specific duties would be:

The contacting of sales representatives.

Secretarial work.

The typing of purchase orders and statements.

The making up of quotation sheets and the listing of bids on bid cards.

Filing.

The keeping of furniture transfer records.

Multigraph Operator:

The multigraph operator should be experienced and thoroughly capable of handling all phases of multigraphing and mimeographing.

[fol. 8088] His specific duties would be as follows:

The setting of forms for multigraph.

The operating of multigraph and mimeograph machines.

The knocking down of forms run on multigraph.

The cutting of mimeograph stencils other than circular letters for various departments.

The cutting of paper for forms run.

The cutting of paper stock for field stationery, file backs, index cards.

The gathering of forms of more than one copy.

The padding of forms.

The washing and repairing of multigraph.

The working up of job tickets on jobs done in shop.

The binding of books.

The Disbursement Record and Invoice Clerk:

The disbursement record and invoice clerk should have general office experience with a working knowledge of stock handling and accounting. His duties would be as follows:

The posting of each day's disbursements and receipts.
The compilation and checking of monthly statement of disbursements and receipts.
The crediting into stock of all material returned.
The keeping of yearly and monthly record on, and passing of all invoices and multigraph job tickets.
The receiving of shipments and deliveries.
The checking of stock currently to avoid overages and shortages.

Assistant Multigraph Operator:

The duties of the assistant multigraph operator would be as follows:

The setting and knocking down of type.
The operating of multigraph and mimeograph machines.
Trimming and padding.
Book binding.
Gathering.
The cutting and trimming of miscellaneous work in building.
Perforating and punching.

Disbursement Clerk:

The duties of the disbursement clerk would be as follows:

The handling of disbursements of supplies to general offices.
[fol. 8089] The receiving and distributing of mail.
The issuing of stationery back orders.
The issuing of notices of disbursements of numbered orders to Automobiles, Purchasing, and Stores Department.
The recording of shipments of all numbered orders or contracts.
The recapping of disbursements daily.
The compiling of records of field shipments.
The checking monthly of stationery disbursements and receipts statements.

Shipping Clerk:

The securing of approval on field requisitions.

The filling, writing-up, wrapping, and stamping of field orders.

The assisting at window of disbursements.

Going to the post office in the afternoon with shipments.

The making of stamp reports daily and monthly.

The shaving of cylinders for dictaphone.

Putting stock in bins.

The receiving and unpacking of freight and express shipments.

Schedule of Salaries

Assisting purchasing agent (Supervisor) Three years, six months $350 per month	$14,700
Chief clerk, Three years, six months $200 per month	8,400
Secretary and order clerk, Three years, six months $150 per month	6,300
Multigraph operator (Chief), Three years, six months $175 per month	7,350
Stock record and disbursement clerk, Three years, six months $125 per month	5,250
Assistant multigraph and mimeograph operator, Three years, four months $100 per month	4,000
Disbursement clerk, Three years, three months $90 per month	3,510
Shipping clerk, Three years, two months $75 per month	2,850
Total	$52,360

Stationery and Office Supplies

Based upon the actual experience of the department during the construction periods of 1927 and 1929, the expenses of the Stationery Department for stationery and office supplies would be as follows:

[fols. 8090-8091]

Pre-construction period	$490.00
Construction period	1,803.00
Total	$2,293.00

Transportation

No transportation cost would be incurred in the reproduction of Lone Star Gas Company.

Traveling Expenses

The traveling expenses of the department have been estimated at $525.00 for the three and one half year period.

Total	$525.00

Communication

The communication expenses of the department have been estimated as follows:

Telephones—exchange service	$1,529.00
Dictograph	700.00
Telephone tolls	1,470.00
Telegraph tolls	630.00
Total	$4,329.00

[fol. 8092] Traffic Department

Summary of Salaries and Expenses

Salaries:		
Pre-Construction period	$1,275	
Construction period	22,500	
		$23,775
Office Furniture and Fixtures:		
Depreciation based on total cost of $541 as shown by detailed inventory		151
Stationery and Supplies:*

Construction period	750	
		1,000
Communication:		
Pre-Construction period	$28	
Construction period	80	
		108
Total		$25,546

* Includes Interstate Commerce Commission Reports, advance copies Interstate Commerce Commission Reports, and one Hawkins' Digest.

(NOTE.) Office rent is included under Undistributed General Costs. The estimated net floor space that would be required for the Traffic Department is 420 square feet.

Duties of the Department and Personnel Analysis:

This department would report directly to the purchasing agent.

Transportation matters, particularly freight rates and routing, are intricate, therefore, trained, experienced technical man would be required. Traffic management would be essential in the economical reproduction of Lone Star Gas Company. "It is basic and fundamental to the elimination of industrial waste incident to transportation; it is recognized as indispensable to large concerns; and it renders many valuable but immeasurable services to all depart- [fol. 8093] ments which alone justify its maintenance". (Industrial Traffic Management Survey by U. S. Department of Commerce * * * Domestic Commerce Series No. 39.)

The Traffic Department's main contact would be with transportation agencies, also State and Federal Transportation Regulatory Bodies, with which matters covering freight rate adjustments would be handled.

Traffic Manager:

The specific duties of the traffic manager would be:

The supervision of the work of the Traffic Department.

The obtaining of new rates and ratings.

The obtaining of revisions in tariffs and regulations.

The securing of rate and classification adjustments or the prevention.

The determination of available freight routings and other modes of transportation.

The routing of shipments.

The responsibility for company paying just and reasonable transportation.

The quoting of rates.

The assembling of evidence for rate cases.

The filing of informal, formal, and special docket complaints.

The practice before carrier and governmental regulatory bodies.

The preparation and filing of briefs for traffic cases.

The preparation of claims for loss and damage.
The keeping of executives and others informed of current traffic changes.
The arranging of average demurrage agreements.

Rate Clerk:

The specific duties of the rate clerk would be as follows:

The routing of shipments.
The checking of freight bills for proper charges.
The tracing of shipments.
The securing of tariffs and classifications, and the maintenance of tariff file.
The assisting of the traffic manager in preparation of claims.
The studying of tariffs and keeping informed of rate changes.
The handling of diversion, or reconsignments of shipments.
The checking of transportation items on invoices.

fols. 8094-8095] Secretary:

The specific duties of the secretary would be:

The taking of dictation and writing of letters.
The handling of requisitions for supplies.
The maintenance of correspondence and claim files.
The recording of claims in claim register.
The recording of checks in payment of claims.
The following up of open claims.
The securing of freight bills and invoices to support claims.
The typing of exhibits and statements in rate cases.

Schedule of Salaries

Position	Monthly Rate	Annual Rate
Traffic manager	$300	$3,600
Rate clerk	200	2,400
Secretary	125	1,500

Stationery and Office Supplies

Based upon the actual experience of the department, the expenses of the Traffic Department for stationery and office

supplies for the three and one half years have been estimated as follows:

Office supplies	$200.00
Interstate Commerce Commission reports	256.50
Advance copies $10.00 per year	30.00
One Hawkins' Digest	25.00
Total	$511.50

Transportation and Traveling Expenses

The transportation and traveling expenses of the Traffic Department for the three and one half year period have been estimated at $1,000.00.

Total	$1,000.00

Communication

The communication expense of the Traffic Department has been estimated at $108.00.

Total	$108.00

[fol. 8096] Other General Costs

General Summary

Office building costs	$134,820
Compensation insurance	9,487
Mail room expense	11,550
Certification of expenditures	35,000
Fidelity bond expense	10,717
Total	$201,574

[fol. 8097]

Summary of Costs

Pre-Construction Period:

Office building costs	$19,260
Compensation insurance	1,357
Mail room expense	1,650
Certification of expenditures	5,000
Fidelity bond expense	1,531
Total	$28,798

Defendant's Exhibit No. 28—Continued

Construction Period—First Year:

Office building costs	$38,520
Compensation insurance	2,710
Mail room expense	3,300
Certification of expenditures	10,000
Fidelity bond expense	3,062
Total	$57,592

Construction Period—Second Year:

Office building costs	$38,520
Compensation insurance	2,710
Mail room expense	3,300
Certification of expenditures	10,000
Fidelity bond expense	3,062
Total	$57,592

Construction Period—Third Year:

Office building costs	$38,520
Compensation insurance	2,710
Mail room expense	3,300
Certification of expenditures	10,000
Fidelity bond expense	3,062
Total	$57,592

[fol. 8098]

Immediately upon the completion of corporate organization, steps would be taken to provide suitable quarters for the executives and the various departmental sections that would function throughout the pre-construction and construction periods. This would be done either by the rental of office space, the construction of permanent quarters, or by the purchase of a suitable structure.

Inasmuch as Lone Star Gas Company owned a general

office structure as of January 1, 1933, the most practical method of estimating the cost of rent during the pre-construction and construction periods is to assume that the company would acquire this building at the date of incorporation, and to fix the cost of rent upon the basis of historical operating costs including taxes and depreciation. The interest charges upon the reproduction cost of the building, and the fair market value of the land have been included in the cost of Interest During Construction and are therefore omitted from the estimate of rental charges.

The floor space required for each department that would be engaged in reproduction has been separately determined in the subsequent analyses. The aggregate floor space required indicates the necessity for the use of the entire building throughout the pre-construction and construction periods. For this reason, the cost of rent has not been segregated, but is included in the estimate as a general undistributed charge.

The General Office Structure and the General Office land owned by Lone Star Gas Company as of January 1, 1933 consisted of a ten story and basement office building, the land upon which the building is located and an adjoining lot seventy feet by ninety three feet used and useful for the [fol. 8099] purpose of parking company owned automobiles. The structure is properly designed for the purpose of accom-odating the organization during construction and the use of the parking lot would be essential.

The original cost of the land and the estimated reproduction cost of the building and its integral equipment as of January 1, 1933 were as follows:

General office land	$44,545.00
Parking lot land	18,052.00
General office structure	321,438.00
Total	$384,035.00

The General Office Structure has available for use the following areas, exclusive of elevator shafts, janitor's closets and lavatories, but inclusive of all corridors:

Defendant's Exhibit No. 28—Continued

First Floor	Square Feet
Space 1—315 South Harwood Street*	1,132.75
Space 2—313 South Harwood Street*	1,412.43
Space 3—311 South Harwood Street	1,401.75
Space 4—309 South Harwood Street	1,201.50
Space 5— Inside	475.23
Lobby	806.09
Total area nine floors 9 x 5,507.25 Square feet—area each typical floor	49,565.25
Total: Area exclusive of basement	55,995.00
Total: Area exclusive of basement, lobby and rentable area	52,043.73

*Rentable.

The average operating expenses of the General Office Structure including an annual charge of three per cent for depreciation on the reproduction cost for the years 1929, and 1930, are shown in the following tabulation. The operating expenses for the year 1933 could not be used due to the fact that certain inter-building charges were made between Lone Star Gas Company, and Dallas Gas Company during 1933 which would not be definitely segregated.

[fol. 8100]

Item	Amount 1929	Amount 1930	Average Amount
Repairs to Machinery	$109	$286	$198
Repairs to Building	577	100	339
Light and Power	4,219	4,995	4,607
Building Engineer and Helper	3,763	3,809	3,786
Water	342	373	358
Fuel	1,782	1,667	1,725
Insurance	1,158	1,251	1,205
Towel Supply	503	313	408
Miscellaneous Supplies	877	1,243	1,060
Light Globes and Electrical Equipment	130	192	161
Lubricating Oils	6	14	10
Janitor Service	8,292	9,237	8,765
Miscellaneous Tools	175	244	210

Defendant's Exhibit No. 28—Continued

Item	Amount 1929	Amount 1930	Average Amount
Advalorem Taxes (1932):			
Office Building and Site			$6,851
Parking Lot			288
Furniture and Fixtures			346
Depreciation 3% on $321,438			9,643
Total Annual Charges			$39,960
Less: Rentals			1,440
Net Annual Charges			$38,520

Office Building Costs—By Periods

Pre-Construction Period	$19,260
Construction Period—First Year	38,520
Construction Period—Second Year	38,520
Construction Period—Third Year	38,520

The office building would be used for construction in housing the personnel of some sections during the Post-Construction Period. It is assumed, however, that this construction charge would be offset by the fact that the building would not be fully occupied until the begining of the First Construction Year.

Compensation Insurance

The annual rate for compensation insurance for office employees as of January 1, 1933 was eight cents for each one hundred dollars of payroll. For engineers engaged in field work, the man-ual rate was $1.21 for each one hundred dollars of payroll.

[fol. 8101] The salaries for the various sections, as determined by the analyses are as follows:

Defendant's Exhibit No. 28—Continued

Executive Section	$397,925
Legal Section	138,120
Accounting Section	159,461
Treasury Section	87,925
Land Section	184,200
Geological Section	160,050
Purchasing Section	399,560
Engineering Section (Office)	670,066
Supervision	516,050
Other General Costs	11,550
Total	$2,724,907
Engineering Section (Field)	$603,895
Office Salaries $2,724,907 at 8 cents per $100.00	$2,180
Field Engineer's Salaries $603,895 at $1.21 per $100.00	7,307
Total	$9,487

Compensation Insurance—by Periods

Pre-Construction Period	$1,357
Construction Period—First Year	2,710
Construction Period—Second Year	2,710
Construction Period—Third Year	2,710

Mail Room Expense

The mail room personnel would be composed of one head clerk and two assistant clerks. They would be employed throughout the Pre-Construction and Construction Periods. Their salaries would be as follows:

Chief Clerk	$1,500 per annum
Assistant Clerk	900 per annum
Assistant Clerk	900 per annum

Mail Room Expense by Periods:

Pre-Construction Period	$1,650
Construction Period—First Year	3,300
Construction Period—Second Year	3,300
Construction Period—Third Year	3,300

[fol. 8102] Certification of Expenditures

The provisions of any mortgage under which funds would be advanced for the construction of the Property of Lone Star Gas Company, would require that all expenditures for construction and other general charges be checked and certified to by some independent auditing firm of national recognition. The minimum fee for such services as could be required in the reproduction of Lone Star Gas Company would be not less than $10,000 per annum. This fee would be paid by the company; although the auditing firm would be selected by the trustee.

Certification of Expenditures Costs by Periods:

Pre-Construction Period	$5,000
Construction Period—First Year	10,000
Construction Period—Second Year	10,000
Construction Period—Third Year	10,000

Fidelity Bond Expense

In the reproduction of the property and business of Lone Star Gas Company, it would be necessary for the company to be insured against fidelity losses by a Primary Blanket Fidelity Bond which would embrace the company's bondable employees. These bondable employees would be divided into three classes, A, B, and C, which are defined as follows:

"Class A—Executives, officials and all Employees who, as a part of their regular duties, Handle or Have Custody of Money, Securities or Merchandise, including in any event auditors, assistant auditors, adjustors, purchasing agents, buyers, managers, assistant managers, branch managers, superintendents, bookkeepers, cashiers, outside salesmen, shipping or receiving clerks, stock clerks, outside messengers, paymasters, timekeepers and collectors."

"Class B—Employees, other than those included in Classes A and C, Who Do Not, as a part of their regular duties, Handle or Have Custody of Money, Securities or Merchandise, including in any event inside salesmen, inside messengers, office and filing clerks, mail clerks, stenogra-

[fols. 8103-8104] phers, typists, business machine operators, telephone switchboard operators, janitors and porters."

"Class C—Wage earners (including foremen, factory workers, mechanics and laborers) Who Do Not, as a part of their regular duties, Handle Money."

It is estimated that an average of 80 employees would be embraced in Class A, an average of 250 in Class B, and a substantially larger number in Class C. A coverage of not less than $200,000 would be required for proper security of funds. The annual premium on a bond of this amount would be $3,063.

Fidelity Bond Expense—by Periods:

Pre-Construction Period	$1,531
Construction Period—First Year	3,062
Construction Period—Second Year	3,062
Construction Period—Third Year	3,062

[fol. 8105]

Summary

General Engineering Costs

First Year:

General Payroll, Travelling Expenses and Fees	$246,646.60	
Office and Field Equipment, Supplies and Expenses	17,478.72	
Field Payroll and Expenses	239,242.72	
		$503,368.04

Second Year:

General Payroll, Traveling Expenses and Fees	173,824.00	
Office and Field Equipment, Supplies and Expenses	11,354.51	
Field Payroll and Expenses	181,868.07	
		367,046.58

Third Year:

General Payroll, Traveling Expenses and Fees	126,659.00	
Office and Field Equipment, Supplies and Expenses	6,985.12	
Field Payroll and Expenses	105,622.25	
		239,266.37

Defendant's Exhibit No. 28—Continued

Fourth Year:		
General Payroll and Traveling Expenses	$17,700.00	
Office Equipment, Supplies and Expenses	280.19	
		$17,980.19
Grand Total—General Engineering Costs		$1,127,661.18

[fols. 8106-8109] Summary

Reproduction Cost of Final Engineering Records

Second Year:		
General Payroll and Travelling Expenses	$136,320.00	
Office and Field Equipment, Supplies and Expenses	11,231.00	
Field Payroll and Expenses	198,751.15	
		$346,302.15
Third Year:		
General Payroll and Travelling Expenses	88,659.60	
Office and Field Equipment, Supplies and Expenses	7,991.59	
Field Payroll and Expenses	156,484.80	
		253,135.99
Fourth Year:		
General Payroll and Travelling Expenses	68,307.00	
Office and Field Equipment, Supplies and Expenses	9,389.71	
Field Payroll and Expenses	88,555.50	
		166,252.21
Grand Total—Reproduction Cost of Final Engineering Records		$765,690.35

(Note.) The Reproduction Cost of Final Engineering Records are included as a part of Direct Structural Costs, Volume I, of this report.

[fol. 8110] General Engineering Costs and Reproduction Cost of Final Engineering Records

Definition:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company, General Engineering Costs and Reproduction Cost of Final Engineering Records are intended to cover the fees and expenses of consultants, the salaries and expenses of the chief engineer, the office engineers, assistant engineers, draftsmen, designers, photostat and blue print operators, clerks and stenographers from the date of the incorporation of the company until such time as the permanent engineering records in possession of Lone Star Gas Company as of January 1, 1933, would be completed. Also the cost of all supplies, office rent or its equivalent cost, tolls, telephones and telegrams, automobile expenses, insurance on employees, bonding expenses, depreciation on furniture, fixtures and equipment, and other expenses that would be incurred in the design of the constituent items of property, the preparation and maintaining of engineering records, and in the general engineering supervision of construction.

This estimate of general engineering does not include the engineering costs that would be incurred prior to the incorporation of the company and specifically treated in connection with Preliminary Development Costs, special fees paid for the design of special structures and included in the physical cost of these structures, and engineering costs directly charged to specific property accounts in the estimate of the structural costs of the physical property of Lone Star Gas Company as of January 1, 1933.

[fol. 8111] Schedule of Engineering Work:

The work that would be done by the engineering section in the reproduction of Lone Star Gas Company as of January 1, 1933, would require four years for completion. There would be three years of preliminary engineering and three years of final engineering. For two years the preliminary engineering and final engineering would be carried on concurrently.

The preliminary engineering work would be done prior to and for the construction. The final engineering work would be done after construction for permanent records, and for the operation of the property.

The first year of engineering would consist of the first year of preliminary engineering and would start six months before actual construction begins.

The Second year of engineering would consist of the second year of preliminary engineering and the first year of final engineering.

The third year of engineering would consist of the third year of preliminary engineering and the second year of final engineering.

The fourth year of engineering would consist of the third year of final engineering and would be completed six months after construction.

The schedule as above outlined is shown in graphic form in Chart of Distribution of Engineering as Related to the Construction Period.

Organization Plan, Duties of the Section, and Personnel Analysis:

The employment of the chief engineer and the office engineer would follow immediately upon the completion of cor- [fol. 8112] porate organization and the selection of the executive officers of the company.

The chief engineer and the office engineer would be furnished with copies of the preliminary engineering reports prepared for the operating group and would be advised by the general manager as to the plans of the management and the general scope and nature of the project. With this information in hand they would work out an organization covering the necessary personnel for the General Engineering Section.

The personnel indicated by the general engineering chart would be employed immediately.

The chief engineer would report to the vice president and general manager and to the general superintendent. He would supervise the work of the engineering organization, consult with and advise the heads of all construction groups in emergency matters, contact and retain all necessary consultants and specialists whose services would be required in the design and construction of the entire property and visit the various points on the property during construction when his judgment and advice would be required.

The secretary for the chief engineer would be a man of experience in order to properly handle the chief engineer's

correspondence, keep such files as the chief engineer would require to be at hand, interview callers in the chief engineer's absence, and similar duties that would arise.

The office engineer would report to the chief engineer. He would supervise and co-ordinate the work of the statistical engineer, field engineers, designing engineer, and the chief draftsman, He would contact and consult with the various department heads and assistant department heads in order [fol. 8113] to obtain such material, information and data as would be required from them by the engineering organization.

The remaining personnel of the engineering organization would consist of four groups, as follows:

The statistical engineers group which would consist of computers, inventory men, and stenographers.

The computers would receive the necessary data from the field engineers and make all calculations for line sizes in order to obtain the proper size lines in order to deliver the required gas at the points of delivery and maintain proper operating conditions. They would figure all material for pipe lines, telephone lines, compressor stations, measuring and regulating stations, and all other structures required to complete the property. They would prepare estimates of all units, write descriptions for all lands to be purchased or leased (except mineral leases), assemble all data for staking well locations and making lease surveys, and they would calculate all lease acreage and check all lease descriptions of the mineral leases for the Land and Lease Department.

The inventory men would keep daily progress of all construction on maps and forms prepared for that purpose; they would prepare a weekly report, summarize the progress of all construction, and charts to accompany same; they would keep a permanent detailed record of all pipe lines, including the length, size, type, date of completion, and date of final inventory; they would keep a permanent record of all leases purchased, including the lease number, name of lessor, area, county in which the lease is located, size of plat and by whom platted in case a plat had been made, name of the survey party and date of survey in case a survey had been made, and such other data pertaining to the leases; and they [fol. 8114] would keep an up to date summary book showing the total amounts of pipe laid by sizes and kinds, as well as preparing a statement at the end of each period, giving the same information.

The stenographers would type all requisitions for material to be used in construction which would include checking the purchase orders and material received reports with the original requisitions to avoid discrepancy; they would type all descriptions prepared by the computers for all necessary sites to be secured; they would type all estimates of cost of construction prepared by the computers; they would type all correspondence with the field engineers and surveying parties, and other miscellaneous correspondence and office work; they would type all progress reports of construction, and also all pipe line statements; and one of the stenographers would keep files (except the filing of notes and drawings mentioned later) of the engineering department.

The group of field engineers would count and locate the houses in the communities under consideration for service, and classify the probable consumers as to probable consumption.

They would supervise the work of the survey parties, contact all field organization in order to correlate the engineering departments field work with the other groups in order to obtain an efficient and prompt dispatch of all work done in connection with the other groups, make reconnoissance surveys, supervise the bridge inspectors, and do all other work of this character that might become necessary.

One group of designers under the supervision of the designing engineer would furnish all necessary data to the draftsmen for the drawing up of all plans, write all specifi- [fol. 8115] cations for the construction of all plants and structures, and interview the representatives of the manufacturers of all equipment that would be considered for all plants and structures.

Another group would work under the supervision of the chief draftsman, who would have such assistants as would be necessary for the proper supervision of this group. This group would consist of draftsmen, file clerks, blueprint operators, and a photostat operator. This group would draw all maps, plans and charts, maintain files of all drawings and notes, correspondence, and data used in the preparation of the drawings, mount the system map as the sheets were made, make blueprints, photostat prints, and keep a set of maps posted to date for the general superintendent, chief engineer, production superintendent, and the superintendent of the Lease Department.

Defendant's Exhibit No. 28—Continued

Schedule of Salaries

	Month	Year
Chief Engineer	$1,000	$12,000
Office Engineer	400	4,800
Chief Draftsman	300	3,600
Designing Engineer	300	3,600
Field Engineer (Head of group)	300	3,600
Statistical Engineer	300	3,600
Assistant Chief Draftsman (Head)	275	3,300
Field Engineers	275	3,300
Designers	250	3,000
Assistant Chief Draftsman	250	3,000
Computers	200	2,400
Secretary for Chief Engineer	175	2,100
Draftsman (Average)	170	2,040
Inventory men	170	2,040
Photostat operator	160	1,920
Blueprint operator	160	1,920
Blueprint Photostat helper	150	1,800
File Clerk (Head of group)	150	1,800
Stenographer (Head of group)	135	1,620
File Clerks	125	1,500
Stenographers	125	1,500
Car cost	175	2,100
Expenses per man	125	1,500

Helpers employed locally by field engineers to assist in house counting $4.00 per day.

[fol. 8116] Schedule of Salaries

Total	109,761	Hours

Defendant's Exhibit No. 28—Continued

109,761 divided by 2206 = 49.76 Draftsmen Years
File Clerks—1 for each 15 Draftsmen
49.76 divided by 15 = 3.32 File Clerk Years
Photostat Operator.....Entire year
Blueprint Operator.....Entire year
Blueprint-Photostat Helper.....Entire year

(Note.) In the estimated man years for computers, inventory men, stenographers, designers and draftsmen, 2206 hours of work per man per year has been used as effective. This figure was obtained as follows:

Days per year		365.00
Sundays	52.00	
Saturdays 52 half days or	26.00	
Holidays	7.00	
Time lost account of sickness (1930 and 1931 experience)	4.25	
		89.25
Effective Days		275.75
275.75 at 8 hours per day		2,206.00 Hours

(Note.) In the estimated man days for field engineers 255 days of work per man per year has been used as an effective year. This figure was obtained as follows:

Days per year		365.00
Sundays	52.00	
Saturdays 52 half days or	26.00	
Holidays	7.00	
Sickness	4.00	
Bad weather and travelling	21.00	
		110.00
Effective Days		255.00

[fol. 8122] First Year Details

(Note.) In connection with all details wherein quantities are designated Preliminary and Final, in each of the three years the Preliminary quantities are applicable to the engineering year under which they are shown while the Final quantities are applicable to the following years engineering.

For example, in the detail of First Year Statistical Engineer, the preliminary time spent by inventory men is applicable to the first year's engineering while the final time for inventory men shown in detail of First Year Statistical Engineer is applicable to second year's engineering.

Traveling Expenses, Fees, and Pay Roll for Second Year of Engineering

General Engineering Cost

Chief Engineer	$12,000.00	
Secretary of Chief Engineer	2,100.00	
Office Engineer .51 year at $4,800.00	2,448.00	
		$16,548.00
Statistical Engineer .86 year at $3,600.00	3,096.00	
Computers 4.68 at $2,400.00	11,232.00	
Inventory Men 1.70 at $2,040.00	3,468.00	
Stenographer (Head of Group)	1,620.00	
Stenographers 1.93 at $1,500.00	2,895.00	
		22,311.00
Field Engineer (Head of Group)	3,600.00	
Field Engineers 2.59 at $3,300.00	8,547.00	
		12,147.00
Designing Engineer	3,600.00	
Designers 3.54 at $3,000.00	10,620.00	
		14,220.00
Chief Draftsman .44 year at $3,600.00	1,548.00	
Ass't Chief Draftsman (Head of Group)	3,300.00	
Ass't Chief Draftsman 1.14 at $3,000.00	3,420.00	
Draftsmen 32.11 at $2,040.00	65,504.40	
File Clerk (Head of Group)	1,800.00	
File Clerks 1.14 at $1,500.00	1,710.00	
Photostat Operator .80 at $1,920.00	1,536.00	
Blueprint Operator .58 at $1,920.00	1,113.60	
Blueprint-Photostat Helper .69 year at $1,800.00	1,242.00	81,210.00
Car Cost 4.59 at $2,100.00		9,639.00
Expenses 4.59 men at $1,500.00		6,885.00
Helpers counting houses—216 days at $4.00		864.00
Consulting Fees		10,000.00
Total		$173,824.00

[fol. 8214]

Traveling Expenses and Payroll for Second Year of Engineering

Reproduction Cost of Final Engineering Records

Office Engineer .49 year at $4,800.00		$ 2,352.00
Statistical Engineer .14 at $3,600.00	504.00	
Inventory men .55 at $2,030.00	1,122.00	
Stenographers 1.00 at $1,500.00	1,500.00	
		3,126.00
Field Engineers 4.06 at $3,300.00		13,398.00

Defendant's Exhibit No. 28—Continued

Chief Draftsman .56 year at $3,600.00	$2,016.00	
Ass't Chief Draftsman 2.82 at $3,000.00	8,460.00	
Draftsman 42.34 at $2,040.00	86,373.60	
File Clerks 2.82 at $1,500.00	4,230.00	
Photostat Operator .20 year at $1,920.00	384.00	
Blueprint Operator .42 year at $1,920.00	806.40	
Blueprint-Photostat Helper .31 year at $1,800.00	558.00	
		$102,828.00
Car Cost 4.06 at $2,100.00		8,526.00
Expenses 4.06 men at $1,500.00		6,090.00
Total		$136,320.00

[fol. 8215]

Engineering Personnel Required for the Second Year of Engineering

General Engineering Costs

Chief Engineer		Entire year
Secretary of Chief Engineer		Entire year
Office Engineer		
Total work done under his supervision Second Year	112.42	Years
Work done, general engineering cost, under his supervision, Second Year	57.20	Years
57.20 divided by 112.42 = .51 Office Engineer Years.		
Statistical Engineer		
Total work done under his supervision Second Year	10.86	Years
Work done, general engineering cost, under his supervision, Second Year	9.31	Years
9.31 divided by 10.86 = .86 Statistical Engineer Cost		
Computers as shown in detail	9,020	Hours
Plus 10% Omissions and Contingencies	902	
Total	9,922	Hours
90% of 8.06 = 7.25		
7.25 x 2118 = 15,355 which is more than sufficient for Second Year		
9.922 divided by 2118 = 4.68 Computers Years		
Inventory Men, as shown in detail	3,278	Hours
Preliminary Second Year		
Plus 10% Omissions and Contingencies	328	
Total	3,606	Hours
3,606 divided by 2118 = 1.70 Inventory Men Years		
Stenographers as shown in detail	5,643	Hours
Preliminary Second Year		
Plus 10% Omissions and Contingencies	564	
Total	6,207	Hours
6,207 divided by 2118 = 2.93 Stenographer Years		

Defendant's Exhibit No. 28—Continued

Field Engineers
Survey Party Days—Preliminary Second Year.... 2,465 Days
2,465 divided by 3 = 822 Field Engineer Days
Obtaining Data for Calculating pressure and volumes..... 54
Total..... 876 Days
876 divided by 244 = 3.59 Field Engineer Years

[fol. 8216]

Designing Engineer..... Entire year
Designers as shown in detail..... 6,811 Hours
Plus 10% Omissions and Contingencies..... 681
Total..... 7,492 Hours
90% of 5.40 = 4.86
4.86 x 2118 = 10,293 Hours
which is more than sufficient for Second Year
7,492 divided by 2118 = 3.54 Designer Years
Chief Draftsman
Total work done under his supervision Second Year. 87.37 Years
Work done, general engineering cost, under his supervision—second year..... 38.46
38.46 divided by 87.37 = .44 Chief Draftsman Years
Assistant Chief Draftsmen—1 for each 15 draftsmen
32.11 divided by 15 = 2.44 Assistant Chief Draftsmen Years
Draftsmen as shown in detail..... 61,836 Hours
Plus 10% Omissions and Contingencies..... 6,184
Total..... 68,020 Hours
68,020 divided by 2118 = 32.11 Draftsmen Years
File Clerks—1 for each 15 Draftsmen
32.11 divided by 15 = 2.14 File Clerk Years
Photostat Operator—3290 divided by 4120 = .80 Year
Blueprint Operator—92,062 divided by 157,635 = .58 Year
Blueprint-Photostat Helper .69 Year

[fol. 8217] Engineering Personnel Required for the Second Year of Engineering

Reproduction Cost of Final Engineering Records

Office Engineer
Total Work done under his supervision, Second Year..... 112.42 Years
Work done under his supervision, Reproduction cost of Final Engineering Records, Second Year.. 55.22 Years
55.23 divided by 112.43 = .49 Office Engineer Years

Defendant's Exhibit No. 28—Continued

Statistical Engineer	
Total work done under his supervision, Second Year	10.86 Years
Work done under his supervision, Reproduction cost of Final Engineering Records, Second Year	1.55 Years
1.55 divided by 10.86 = .14 Statistical Engineer Years	
Inventory Men, as shown in Detail	
Final First Year	1,080 Hours
Plus 10% Omissions and Contingencies	108
Total	1,188 Hours
90% of 2.33 = 2.10	
2.10 less 1.70 (No. employed in General Engineering Cost Work) = .40	
.40 × 2118 =	847 Hours
Total	341 Hours
341 divided by 2206 = .15	
.40 plus .15 = .55 Inventory men years	
Stenographers as shown in detail	
Final First Year	1,958 Hours
Plus 10% Omissions and Contingencies	196
Total	2,154 Hours
90% of 3.83 = 3.45	
3.45 less 2.93 (No. employed in General Engineering Cost Work) = .52	
.52 × 2118 =	1,101
Total	1,053 Hours
1,053 divided by 2206 = .48	
.52 plus .48 = 1.00 Stenographer Years	
Field Engineers	
Survey party days in detail Final first Year	3,091 Days
3,091 divided by 3 = 1,030 Field Engineer Days	
90% of 4.58 = 4.12	
[fol. 8218] 4.12 less 3.59 (No. employed in General Engineering Cost Work) = .53	
.53 × 244 = 129	
Total	901
901 divided by 255 = 3.53	
.53 plus 3.53 = 4.06 Field Engineer Years	
Chief Draftsman	
Total work done under his supervision, Second Year	87.37 Years
Work done under his supervision, Reproduction cost of Final Engineering Records, Second Year	48.91 Years
48.91 divided by 87.37 = .56 Chief Draftsmen Years	
Assistant Chief Draftsmen—1 for each 15 Draftsmen	
42.34 divided by 15 = 2.82 Assistant Chief Draftsmen Years	

Defendant's Exhibit No. 28—Continued

Draftsmen as shown in detail		
Final First Year	83,898	Hours
Plus 10% Omissions and Contingencies	8,390	
Total	92,288	Hours
90% of 49.76 = 44.78		
44.78 less 32.11 (No. employed in General Engineering Cost Work) = 12.67		
12.67×2118 =	26,835	
Total	65,453	Hours
65,453 divided by 2206 = 29.67		
12.67 plus 29.67 = 42.34 Draftsmen Years		
File Clerks—1 for each 15 Draftsmen		
42.34 divided by 15 = 2.82 File Clerk Years		
Photostat Operator	20	Years
Blueprint Operator	42	Years
Blueprint-Photostat Helper	31	Years

(NOTE.) In the estimated man years for computers, inventory men and stenographers, 2118 hours of work per man has been used as effective for 90% of the men employed the previous year. This figure was obtained as follows:

Days per year	365.00	
Sundays	52.00	
Saturdays 52 half days or	26.00	
Holidays	7.00	
Sickness	4.25	
Vacations	11.00	
	100.25	
Effective Days	264.75	
264.75 at 8 hours per day	2,118.00	Hours

[fol. 8219]

(NOTE.) In the estimated man days for field engineers, 244 days of work per man has been used as an effective year for 90% of the men employed the previous year. This figure was obtained as follows:

Days per year	365.00	
Sundays	52.00	
Saturdays 52 half days or	26.00	
Holidays	7.00	
Sickness	4.00	
Bad weather and traveling	21.00	
Vacation	11.00	
	121.00	
Effective Days	244.00

[fol. 8285]

Traveling Expenses, Fees, and Payroll for Third Year of Engineering General Engineering Cost

Chief Engineer		$12,000.00	
Secretary of Chief Engineer		2,100.00	
Office Engineer			
.52 year at	$4,800.00	2,496.00	$16,596.00
Statistical Engineer			
.83 year at	3,600.00	2,988.00	
Computers 2.53 at	2,400.00	6,072.00	
Inventory Men			
1.24 at	2,040.00	2,529.60	
Stenographer (Head of Group)		1,620.00	
Stenographers			
.73 year at	1,500.00	1,095.00	14,304.60
Field Engineer (Head of Group)		3,600.00	
Field Engineers			
1.70 at	3,300.00	5,610.00	9,210.00
Designing Engineer		3,600.00	
Designers 2.06 at	3,000.00	6,180.00	9,780.00
Chief Draftsman			
.46 year at	3,600.00	1,656.00	
Ass't Chief Draftsman (Head of Group)		3,300.00	
Ass't Chief Draftsmen			
.36 year at	3,000.00	1,080.00	
Draftsmen 20.36 at	2,040.00	41,534.40	
File Clerk (Head of Group)		1,800.00	
File Clerk			
.36 year at	1,500.00	540.00	
Photostat Operator			
.51 year at	1,920.00	979.20	
Blueprint Operator			
.74 year at	1,920.00	1,420.00	
Blueprint-Photostat Helper			
.31 year at	1,800.00	558.00	52,868.40
Car cost 3.70 at	2,100.00		7,770.00
Expenses 3.70 men at	1,500.00		5,550.00
Helpers counting houses—145 days at $4.00			580.00
Consulting fees			10,000.00
Total			$126,659.00

[fol. 8286]

Traveling Expenses and Payroll for Third Year of Engineering Reproduction Cost of Final Engineering Records

Office Engineer			
.48 year at	$4,800.00		$2,304.00
Statistical Engineer			
.17 year at	3,600.00	$612.00	
Inventory men			
.23 year at	2,040.00	469.20	
Stenographers			
.88 year at	1,500.00	1,320.00	2,401.20
Field Engineers			
3.18 at	3,300.00		10,494.00

Defendant's Exhibit No. 28—Continued

Chief Draftsman .54 year at	3,600.00	1,944.00	
Ass't Chief Draftsman 1.66 year at	3,000.00	4,980.00	
Draftsmen 24.91 at	2,040.00	50,816.40	
Photostat Operator .49 at	1,920.00	940.80	
Blueprint Operator .26 year at	1,920.00	499.20	
Blueprint-Photostat Helper .19 year at	1,800.00	342.00	
			62,012.40
Car Cost 3.18 year at	2,100.00		6,678.00
Expenses 3.18 man at	1,500.00		4,770.00
Total			$88,659.60

[fol. 8287]

Engineering Personnel Required for the Third Year of Engineering General Engineering Cost

Chief Engineer ..... Entire year
Secretary of Chief Engineer ..... Entire year

Office Engineer

Total work done under his supervision, Third Year	71.86 Years
Work done under his supervision, general engineering cost, Third Year	37.50 Years

37.50 divided by 71.86 = .52 Office Engineer Years

Statistical Engineer

Total work done under his supervision, Third Year	6.62 Years
Work done under his supervision, general engineering cost, Third Year	5.50 Years

5.50 divided by 6.62 = .83 Statistical Engineer Years

Computers as shown in detail	4,879 Hours
Plus 10% Omissions and Contingencies	488
Total	5,367 Hours

5,367 divided by 2118 = 2.53 Computer Years

Inventory men, as shown in detail, Preliminary Third Year	2,394 Hours
Plus 10% Omissions and Contingencies	239
Total	2,633 Hours

2,633 divided by 2118 = 1.24 Inventory men Years

Stenographers as shown in detail, Preliminary Third Year	3,325 Hours
Plus 10% Omissions and Contingencies	332
Total	3,657 Hours

3,657 divided by 2118 = 1.73 Stenographer Years

Defendant's Exhibit No. 28—Continued

Field Engineers

Survey Party Days, as shown in Detail, Preliminary Third Year	1,283 Days
1,283 divided by 3 = 428 Field Engineer Days	
Obtaining data for calculating Pressure, volumes, etc., 231 plus 428 =	659 Days
659 divided by 244 = 2.70 Field Engineer Years	
Designing Engineer	Entire year

[fol. 8288]

Designers, as shown in detail	3,981 Hours
Plus 10% Omissions and Contingencies	398
Total	4,379 Hours
4,379 divided by 2118 = 2.06 Designer Years	

Chief Draftsman

Total work done under his supervision, Third Year	54.31 Years
Work done under his supervision, general engineering cost, Third Year	24.95 Years
24.95 divided by 54.31 = .46 Chief Draftsman Years	
Assistant Chief Draftsman—1 for each 15 Draftsmen	
20.36 divided by 15 = 1.36 Ass't Chief Draftsmen Years	

Draftsmen as shown in detail,

Preliminary Third Year	39,198 Hours
Plus 10% Omissions and Contingencies	3,920
Total	43,118 Hours
43,118 divided by 2118 = 20.36 Draftsmen Years	

File Clerks—1 for each 15 Draftsmen	
20.36 divided by 15 = 1.36 File Clerk Years	
Photostat Operator	.51 Years
Blueprint Operator	.74 Years
Blueprint-Photostat Helper	.31 Years

[fol. 8289] Engineering Personnel Required for the Third Year of Engineering

Reproduction Cost of Final Engineering Records

Office Engineer

Total work done under his supervision Third Year	71.86 Years
Work done under his supervision, Reproduction cost of Final Engineering Records	34.36 Years
34.36 divided by 71.86 = .48 Office Engineer Years	

Statistical Engineer

Total work done under his supervision, Third Year	6.62 Years
Work done under his supervision, Reproduction cost of Final Engineering Records	1.11 Years
1.11 divided by 6.62 = .16 Statistical Engineer Years	

Defendant's Exhibit No. 28—Continued

Inventory Men, as shown in detail,

Final Second Year	451 Hours
Plus 10% Omissions and Contingencies	45
Total	496 Hours

496 divided by 2118 = .23 Inventory men Years

Stenographers, as shown in detail,

Final Second Year	1,696 Hours
Plus 10% Omissions and Contingencies	170
Total	1,866 Hours

1,866 divided by 2118 = .88 Stenographer Years

Field Engineers

Survey Party days as shown in detail,

Final Second Year	2,324 Days

2,324 divided by 3 = 775 Field Engineer Days
775 divided by 244 = 3.18 Field Engineer Days

Chief Draftsman

Total work done under his supervision Third Year	54.31 Years
Work done under his supervision, Reproduction cost of Final Engineering Records	29.36 Years

29.36 divided by 54.31 = .54 Chief Draftsman Years

Assistant Chief Draftsmen—1 for each 15 Draftsmen

24.91 divided by 15 = 1.66 Ass't Chief Draftsmen Years

Draftsmen, as shown in detail,

Final Second Year	47,973 Hours
Plus 10% Omissions and Contingencies	4,797
Total	52,770 Hours

52,770 divided by 2118 = 24.91 Draftsmen Years

[fol. 8290]

File Clerks—1 for each 15 Draftsmen

24.91 divided by 15 = 1.66 File Clerk Years

Photostat Operator	.49 Year
Blueprint Operator	.26 Year
Blueprint-Photostat Helper	.19 Year

Defendant's Exhibit No. 28—Continued

[fol. 8340] Engineering Department Office Equipment Cost—Third Year

No. In Use	Item	Total Value Each	Total Value and Depreciation	Amount Charged to Third Year
1	Golden oak desk—glass top 60x30 inches	$79.10	$79.10 at 8%	$6.33
1	Golden oak table—glass top 72x36 inches	58.50	58.50 at 8%	4.68
4	Golden oak swivel arm chairs leather seats	22.00	88.00 at 8%	7.04
12	Golden oak arm chairs—straight	11.85	142.20 at 8%	11.38
5	Golden oak—4 Section Book cases with top base	43.90	219.50 at 8%	17.56
1	Golden Oak telephone table	10.80	10.80 at 8%	.86
13	Golden oak costumers	7.40	96.20 at 8%	7.70
8	Golden oak globe letter trays single	1.60	12.80 at 8%	1.02
1	Rug—14x16 feet	212.50	212.50 at 8%	17.00
2	Smoking Stands	6.34	12.68 at 8%	1.01
2	Sheaffer double fountain pen desk sets	20.00	40.00 at 8%	3.20
8	Golden oak system map frames	12.50	100.00 at 8%	8.00
2	Thermos Bottles with tray and glasses	11.40	22.80 at 8%	1.82
47	Steel mesh waste baskets	.90	42.30 at 15%	6.35
2	Brass cuspidors	2.07	4.14 at 8%	.33
47	Enameled steel cuspidors	.85	39.95 at 8%	3.20
49	Rubber cuspidor mats	.42	20.58 at 25%	5.15
8	Staffords Self inking stamp pads	.29	2.32 at 25%	.58
	Rubber stamps	.....	38.25 at 20%	7.65
2	Bostich staple machine—Exec. type	7.50	15.00 at 8%	1.20
35	Autopoint bakelite pencils	.40	14.00 at 8%	1.12
9	Engineer's Scales—12 inches	3.24	29.16 at 8%	2.33
8	Architect's Scales—12 inches	3.24	25.92 at 8%	2.07
6	Polyphase Duplex slide rules—10 inches in case	8.42	50.52 at 8%	4.04
4	Golden oak typewriter desks—60x34 inches	54.60	218.40 at 8%	17.47
5	Adjustable steel chairs—leather back and seat	17.43	69.72 at 8%	5.58
1	Golden oak settee—48 inches	42.00	42.00 at 8%	3.36
18	Berloy steel filing cabinets	27.30	491.40 at 8%	39.31
4	Royal Standard typewriters	83.03	332.12 at 8%	26.57
4	Remington Line-A-Times	21.00	84.00 at 8%	6.72
4	Sheaffer single fountain pen desk sets	12.00	48.00 at 8%	3.84
1	Rug—10x14 feet	132.00	132.00 at 8%	10.56
2	Secretary's Handbooks	3.50	7.00 at 8%	.56
2	Dictionaries	5.00	10.00 at 8%	.80
21	Bostich staple machines—standard	3.02	63.42 at 8%	5.07

Engineering Department Office Equipment Cost—Third Year

No. In Use	Item	Total Value Each	Total Value and Depreciation	Amount Charged to Third Year
4	Card Index Cases	.60	2.40 at 8%	.19
1	Desk blotter holder	5.50	5.50 at 8%	.44
72	Sets alphabetical indexes for files	.95	68.40 at 25%	17.10
5	Dexter Pencil Sharpeners—No. 2	3.93	16.65 at 8%	1.57
1	Golden oak desk with glass top—66x36 inches	84.00	84.00 at 8%	6.72
1	Golden oak table with glass top—72x34 inches	58.00	58.00 at 8%	4.64
1	Rug—12x14 feet	158.70	158.70 at 8%	12.70
13	Golden oak desks—60x34 inches	54.60	709.80 at 8%	56.78
12	Golden oak swivel chairs—leather seats	18.50	222.00 at 8%	17.76
2	Golden oak tables—60x34 inches	30.80	61.60 at 8%	4.93
4	Golden oak chairs	7.50	22.50 at 8%	1.80
1	Plainimeter	45.00	45.00 at 8%	3.60
2	Marchant Electric Calculators	425.00	850.00 at 8%	68.00
2	Walraven Extension Binders No. L-5840	7.20	14.40 at 8%	1.15
1	Walraven Extension Binders No. L-5888	8.44	8.44 at 8%	.67
4	Vance K. Miller Binders No. 541-A	1.25	5.00 at 8%	.40
1	Underwood Typewriter—26 inch carriage	137.70	137.70 at 8%	11.02
2	Golden oak tables 72x34 inches	35.00	70.00 at 8%	5.60
3	Sheridan Adjustable drawing tables No. 2263.5-B	65.00	195.00 at 8%	15.60
3	Golden oak desk chairs—leather seats	18.50	55.50 at 8%	4.44
7	Tee squares — adjustable heads 42 inches	5.94	41.58 at 8%	3.33
7	45 degree Triangles—18 in.	5.41	30.87 at 8%	2.47
7	30-60 Triangles—18 in.	3.06	21.42 at 8%	1.71
	Steel Shelving		182.25 at 8%	14.58
50	Drafting tables—60x34 inches with drawers	26.25	1,312.50 at 8%	105.00
50	Adjustable wooden drafting stools	12.92	646.00 at 8%	51.68
46	Tee Squares—42 inches	2.86	131.56 at 8%	10.52
1	Globe Wernicke filing cabinet No. 7310-C	1.20	1.20 at 8%	.10
2	Beam compasses in case	12.25	24.50 at 8%	1.96
3	Sets proportional dividers	12.50	37.50 at 8%	3.00
1	Set Wrice lettering guides	35.00	35.00 at 8%	2.80
4	Steel straight edges—48 in.	7.56	30.24 at 8%	2.42
4	Vernier Protractors	9.00	36.00 at 8%	2.88
1	Golden oak table—88x30 in.	48.50	48.50 at 8%	.388

[fol. 8370] Field Engineering Costs

Definition:

The definition and development of General Engineering Costs specifically eliminated all charges for engineering services incurred prior to the incorporation of the company, all fees for special structures, and all charges for engineering included in direct structural costs.

No engineering costs have been included in direct structural costs except those involved in fees for special structures.

Field Engineering Costs as used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company are intended to include the salaries and expenses of the party chief, instrument men, rod men, chain men, bridge inspectors and their helpers who would be engaged in the necessary field work incident to the reproduction of the various units of physical property of Lone Star Gas Company as of January 1, 1933.

The field party equipment cost has been included in General Engineering Expenses.

Survey Parties and Personnel Analysis:

The number of survey party days shown in the detail by years refers to each day's work on each project that would require a survey party consisting of one or more members.

That is, a party making a lease survey or a preliminary survey for a pipe line or telephone line would consist of a party chief, an instrument man, a flagman, a head and rear chainman, and an average of two axemen; a party making a preliminary survey for a compressor station, warehouse, camp site, or a pipe line bridge would consist of a party chief, an instrument man, a rodman, a head and [fol. 8371] rear chainman, and an average of one axeman; while the inspection of a pipe line bridge would require only one bridge inspector.

Likewise a party making a final survey of a pipe line or telephone line would consist of a party chief, an instrument man, and a head and rear chainman, while a party making a final survey of a compressor station, warehouse, camp site, or a pipe line bridge would consist of a party chief, an instrument man, a rodman, and a head and rear chainman.

The chiefs of parties would report to the field engineers. They would lay out and supervise the work of their parties, and would employ locally as many axemen as the work would require, pay them on a day basis. They would be responsible for the proper keeping of the time and expenses of their parties, and also their parties discipline, as well as the accuracy of the work of their parties.

The bridge inspectors would report to the field engineers. They would supervise the work of the bridge contractors and would decide any and all questions as to the quality or acceptability of the materials furnished and work performed, and as to the manner of performance and rate of progress of the work, and they would decide all questions which might arise as to the interpretation of the plans and specifications and to the acceptable fulfillment of the contract by the contractor. They would be authorized to approve any additional work occasioned by unfor-seen local conditions, or work necessary to complete the bridge which is not called for in the plans and specifications.

The instrumentmen would do all level and transit work and would keep sets of accurate, legible, and intelligible

[fol. 8372] notes, and they would help make sketches of equipment on the final survey. In the absence of the party chief, they would assume his responsibility. They would also be responsible for the care and upkeep of the instruments which they would use.

The rodmen would work with the instrumentmen and would be able to make correct rod readings and to understand the instrumentmen's signals, and when required to do so, would be able to keep notes for the instrumentmen. They would be responsible for the care and upkeep of the rods and other equipment they would use.

The flagmen would work with the instrumentmen and would be able to understand the instrumentmen's signals and to make proper set-up points for the instrumentmen.

The chainmen would be responsible for the accurate measurement of all distances, and the head chainman would be able to keep sets of accurate, legible, and intelligible chain notes, and they would help make sketches of equipment on the final survey.

The axemen, who would be employed locally by the party chief, would do all of the necessary clearing for the party, and also carry and drive all stakes.

[fol. 8373] First Year Field Engineering

[fol. 8374] Survey Party Salaries

Personnel	Month	Year
Chief of Party	$250.00	$3,000.00
Chief of Party	225.00	2,700.00
Bridge Inspector	200.00	2,400.00
Instrument Man	200.00	2,400.00
Instrument Man	175.00	2,100.00
Rodman—average	140.00	1,680.00
Flagman—average	140.00	1,680.00
Head Chainman—average	125.00	1,500.00
Rear Chainman—average	110.00	1,320.00
Car Cost	175.00	2,100.00
Expenses per man	106.46	1,277.50

Axemen—employed locally at $4.00 per day.

Job No. 3104. Supreme Court Record No. —

[fol. 8397] First Year Engineering Survey Parties

General Engineering Costs

Surveying party days as shown in detail, preliminary first year—3,314. Being the first year of work, the surveying parties will work the entire 255 days per year, therefore, 3,314 divided by 255 = 13.00 Surveying parties will be required for the first year's work.

[fol. 8398] Second Year Engineering Survey Parties

General Engineering Costs

Surveying days as shown in detail:

Preliminary Second Year ..... 2,465 Days.

2,465 divided by 244=10.10 Survey Parties.

Defendant's Exhibit No. 28—Continued

[fol. 8399] Second Year Engineering Survey Parties

Reproduction Cost of Final Engineering Records

Surveying Days as shown in detail:

Final First Year ..... 3,091 Days.

90% of the parties working the First Year will also work the Second Year.

90% of 13 = 11.70 Parties.

11.70 less 10.10 (No. employed in General Eng. Cost) = 1.60.

1.60 × 244=390.

3,091 less 390 = 2,701 days will be utilized by parties working 255 days.

2,701 divided by 255 = 10.59 additional parties will be required.

1.60 plus 10.59 = 12.10 Parties.

[fol. 8400] Third Year Engineering Survey Parties

General Engineering Costs

Surveying Party days as shown in detail:

Preliminary Third Year ..... 1,283 Days.

1,283 divided by 244 = 5.26 Survey Parties.

[fol. 8401] Third Year Engineering Survey Parties

Reproduction Cost of Final Engineering Records

Surveying Party days as shown in detail:

Final Second Year ..... 2,324 Days.

2,324 divided by 244 = 9.52 Survey Parties.

[fols. 8402-8403] Fourth Year Engineering Survey Parties

Reproduction Cost of Final Engineering Records

Surveying Party days as shown in detail:

Final Third Year ..... 1,428 Days.

90% of the parties working the third year would also work the Fourth Year.

90% of 14.78 = 13.30 parties. These parties would work only 244 days the fourth year. They would, therefore, work

13.30 × 244 = 3,245 days the Fourth Year, which is more than enough to take care of the Fourth year's work.

Hence, all surveying parties will work only 244 days during the Fourth Year. Therefore,

1,428 divided by 244 = 5.85 parties will be required for the Fourth Year's work.

[fol. 8414] General Supervision of Construction Costs and Supervision Costs Allocated to Specific Property Accounts

Definition:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company, General Supervision of Construction Costs are intended to cover the salaries and expenses of the general superintendent of construction, the superintendent of automotive and construction equipment and the engineer in charge of the safety and medical examination department. Also the cost of all supplies, the salaries and expenses of assistants, physicians and examiners, clerks and stenographers, office rent or its equivalent cost, tolls, telephones and telegrams, automobile expense, depreciation on furniture, fixtures and equipment and all other charges that would be attributable to the general su-

pervision of construction, the maintenance and care of automotive and construction equipment, and the safety work and medical examination in the reproduction of the physical property of Lone Star Gas Company as of January 1, 1933.

As used in this estimate, supervision costs allocated to specific property accounts are intended to cover the salaries and expenses of the superintendent of pipe line construction, the superintendent of drilling operations and gas production, the superintendent of compressor station construction and the superintendent of telephone line construction. Also the cost of all supplies, the salaries and expenses of their assistants, clerks and stenographers, office rent or its equivalent cost, tolls, telephones, telegrams, automobile expenses, depreciation on furniture, fixtures and equipment and all other charges that would be attributable to the construction of lines and appurtenant equipment, compressor stations, [fol. 8415] telephone lines and the drilling of wells and the production of gas in the reproduction of the physical property of Lone Star Gas Company as of January 1, 1933.

This estimate of the Cost of General Supervision of Construction and Supervision Cost allocated to specific property accounts does not include the cost of supervision and inspection allocated to specific property accounts and included in the unit costs applied to items of physical property.

While the estimate of Supervision Costs allocated to specific property accounts is set out in this section of the report, it is shown as a part of the cost of reproduction in connection with the general summaries of the reproduction cost of the various property accounts in Volume I of the report.

It is obvious that the duties of the general superintendent and his office organization, the superintendent of automotive and construction equipment and his organization, and the engineer in charge of safety and medical examination together with his staff would be so general in their nature as to prevent the rational distribution of the salaries and expenses of these groups to specific property accounts. For this reason, the salaries and expenses of the general superintendent and his organization, the superintendent of automotive and construction equipment and his organization and the engineer in charge of safety and medical examination and his staff have been separately determined and set out as a part of Undistributed General Costs.

General Organization Plan and Duties of the Construction Section:

In the development of Supervision of Construction Costs that would be involved in the reproduction of Lone Star Gas [fol. 8416] Company as of January 1, 1933, the actual construction organization of the company during recent years in which the company was actually constructing portions of its plant costing more than $20,000,000, has been followed in detail. In no other section of the company's general organization does the history of its own operations furnish a more definite basis for estimate.

In the reproduction of the property of Lone Star Gas Company, the responsible head of the Construction Section would be the general superintendent. Following the division of responsibility set out in the general organization plan, the general superintendent would conduct and direct the work of the Construction Section under the general supervision of the vice-president and general manager of the company.

The Construction Section would be divided into six construction divisions, each division being directly responsible for a definite part of the construction program. The Construction Division would be as follows:

1. Division of Pipe Line Construction.
2. Division of Compressor Station Construction.
3. Division of Telephone Construction.
4. Division of Plant and Equipment.
5. Division of Drilling and Production.
6. Division of Safety and Medical Examination.

Each of the above construction divisions would be in charge of a division superintendent who would report, and be directly responsible to the general superintendent.

In addition to the heads of the Construction Division, the chief engineer, whose specific duties are set out in detail under General Engineering Costs, would report to the general superintendent.

In connection with its general duties, the office of the [fol. 8417] general superintendent would:

1. Direct the general operations of each of the construction Divisions

2. Co-ordinate the work of the Construction Divisions

3. Plan the work from a construction standpoint, and authorize its execution by the proper Division

4. Correlate the progress reports of the various Divisions into a consolidated report for the office of the general manager

5. Approve all plans for construction prepared by the Engineering Section

6. Inspect and approve pipe line routes in different territory

7. Inspect and approve final bridge and under-river crossings

8. Inspect and approve final locations of compressor stations

9. Approve final size of all transmission lines

10. Approve all requisitions for the purchase of materials and equipment

11. Approve well locations and drilling operations.

12. Prepare estimates of progress and probable cash requirements for use by the Treasury Section

The Construction Section would be organized immediately upon the completion of corporate organization by the employment of the general superintendent who in turn would begin the organization of his Construction Divisions by the employment of the Division superintendent in the order that the progress of the work would require.

Personnel Analysis

General Superintendent:

The general and specific duties of the general superintendent have been set out under the discussion of the duties of the office of the general superintendent.

Chief Clerk to the General Superintendent:

The general office of the Construction Section would require a chief clerk whose duties would be confined solely to

the details of the office of the general suprintendent. The routine work of the general superintendent would require his presence in the field at frequent intervals, and at such [fol. 8418] times all office routines would be in charge of the chief clerk.

The chief clerk would also direct the work of the stenographic group in the preparation of all progress reports and other necessary construction reports.

In order to properly perform the duties of his office, the chief clerk would necessarily be a man who had had previous experience in similar work. His duties would require a general familiarity with each phase of the construction in progress, and a familiarity with the office routines of a large construction organization.

Stenographic Group:

The large number of detailed reports that would originate in the office of the general superintendent, together with the large amount of inter-departmental and outside correspondence that the construction program would entail, would require the services of not less than five stenographers during the period of actual construction.

In connection with the office personnel of the general superintendent, it is estimated that the chief clerk would be engaged immediately upon the employment of the general superintendent, that one stenographer would be engaged at the same time, that two additional stenographers would be engaged three months prior to the beginning of construction, and that the organization would be complete at the date of the beginning of actual construction.

Division of Pipe Line Construction

Superintendent of Pipe Line Construction:

The superintendent of pipe line construction would be directly responsible for the construction of all lines including main transmission lines, gathering lines, well lines and [fol. 8419] tap lines, together with all the collateral equipment including measuring station structures and equipment, and regulator station structures and equipment. He would be directly responsible for the progress of the work and the costs of construction. He would also prepare for the gen-

eral superintendent complete progress reports covering the amount of work performed and the cost of same.

A man qualified for this position would necessarily be a man with wide experience in pipe line construction in all of its phases and would also posses- qualities of leadership and executive ability.

Assistant Pipe Line Superintendent:

Owing to the extent of the pipe line construction that would be simultaneously in progress, not less than three assistant superintendents who would have charge of divisional activities would be required for the proper co-ordination and progress of the work. These assistant superintendents would remain constantly in the field and would provide the necessary contacts between the pipe line superintendent and his office and actual construction.

Each of these men would be experienced pipe line constructors, and would also posses- the necessary executive qualifications the co-ordination of the work of the large personnel of direct construction employees would require.

Chief Clerk:

The chief clerk would have responsible charge of the office routines of the pipe line superintendent. He would assist in the preparation of reports and the filing of the same, and also have responsible charge of the office and subordinate employees in the absence of the pipe line superintendent.

The chief clerk would be required to have a general [fol. 8420] knowledge of all matters pertaining to pipe line construction.

Assistant Clerk:

Due to the volume of details that would be handled by the office of the pipe line superintendent during a three year construction period that involved the construction of approximately four thousand miles of pipe lines within a three year construction period, the services of an assistant clerk would be required.

The assistant clerk would assist the chief clerk in all routine matters, summarize the daily progress reports of the

assistant superintendents and construction foremen, keep cost data, assist in filing, and have charge of the work of the stenographers.

Stenographic Group:

Two stenographers would be required for the typing of reports, and the writing of inter-divisional and outside correspondence.

It is estimated that the pipe line superintendent, the chief clerk and one stenographer would be employed three months prior to the beginning of construction, that the assistant superintendents, the assistant clerk and the second stenographer would be employed one month prior to the beginning of construction.

Division of Compressor Station Construction

Superintendent of Compressor Station Construction:

The superintendent of compressor station construction would be directly responsible for the progress and costs of all compressor station construction. He would also be in responsible charge of his office organization and field personnel. He would assist in the preparation of design, the selection of equipment and materials of construction. Together with the general superintendent and chief engineer, he would assist in the selection of compressor station sites, [fol. 8421] sources of water supply, and in other similar matters.

As the construction progressed, he would be responsible for changes in plans and specifications that would be brought about by the contingencies of construction or unfor-seen conditions.

The superintendent of compressor station construction would be a mechanical engineer thoroughly familiar with all details of compressor station construction and operation.

Assistant Superintendents of Compressor Station Construction:

The construction program adopted that contemplates that the compressor stations of Lone Star Gas Company as of January 1, 1933, would be completed during the first and

second construction years would require that four or more stations be under construction simultaneously. An assistant superintendent of construction would be placed in general charge of two or more stations as the progress of the work required. These assistants would remain in the field and keep the office in contact with the field operations. They would also keep accurate records of all construction costs and decide on minor changes in construction requiring prompt attention.

Each of the assistant superintendents would be men experienced in compressor station construction and operation.

The duties of the assistant superintendents can be classified by an outline of the building sequence that the construction program imposes.

Assistant Superintendent Number 1			
First Year			
Unit Number 1	Petrolia	Seven	Months
	Joshua	Three	Months
Unit Number 2	Gas City	Four	Months
[fol. 8422]			
	Fox Central	Three	Months
	Caddo	Five	Months
Second Year			
Unit Number 1	Fox East	Four	Months
	Eastland	Five	Months
	Joshua No. 2	Three	Months
Unit Number 2	Loco	Four	Months
	Ranger No. 1	Four	Months
	Ranger No. 2	Four	Months
Assistant Superintendent Number 2			
First Year			
Unit Number 3	Pueblo	Three	Months
	Breckenridge	Five	Months
	Ibex	Four	Months
Unit Number 4	Ranger No. 4	Three	Months
	Ranger No. 3	Five	Months
	Sipe Springs	Four	Months
Second Year			
Unit Number 3	Brad	Three	Months
	Brazos	Three	Months
	Tiffin	Three	Months
	Alvord	Three	Months
Unit Number 4	x-ray	Three	Months
	Cheaney	Five	Months
	Desdemona	Four	Months

Office Engineer:

The office engineer would assist in the selection of and make requisitions for all materials, plot progress and cost on all units under construction. He would have responsible charge of the office and its routines when the super-

intendent was in the field. He would make such changes in the original designs as actual construction conditions required, and would keep a complete record of such changes. He would check the delivery of all materials, and make estimates for future requirements.

Draftsman:

[fol. 8423] An office draftsman would be required for the purpose of currently maintaining a complete graphic record of each installation, setting out in detail all deviations from original designs and plans.

Stenographic Group:

Two stenographers would be required to prepare and file progress reports, and handle the current correspondence of the office.

It is estimated that the superintendent of compressor station construction and one stenographer would be employed four months prior to the beginning of construction. The assistant superintendents, office engineer, draftsman, and one stenographer would be employed two months prior to the beginning of construction.

Division of Telephone System Construction

Superintendent of Telephone System Construction:

The superintendent of telephone system construction would have responsible charge of the construction of the entire telephone system of Lone Star Gas Company as of January 1, 1933. He would be directly responsible for the progress and cost of the work. He would prepare for the information of the general superintendent progress reports and cost data, and would be generally responsible for the personnel engaged in his division.

The nature of his work would demand that he be experienced in construction, and have specific knowledge of the details of telephone line construction and operation.

Assistant Superintendent:

For the purpose of establishing inter-communication between the field and general office as quickly and as com-[fol. 8424] pletely as possible, it would be necessary to

maintain telephone line construction crews at various points in the system. This construction program would require the employment of — assistant superintendent who would remain in the field and co-ordinate the work of the various construction organizations. He would furnish the general office full information covering progress and cost data.

Clerk:

One office clerk would be required to tabulate and file all information relative to progress and costs. He would also have charge of the office routines in the absence of the superintendent.

Stenographer:

One stenographer would be required for the typing of reports and the maintenance of inter-departmental and outside correspondence.

The superintendent of telephone system construction and stenographer would be employed three months prior to the beginning of construction, and the assistant superintendent and clerk one month prior to the beginning of construction.

Division of Plant and Equipment

Superintendent of Plant and Equipment:

Under the organization plan of Lone Star Gas Company, the superintendent of plant and equipment would be generally responsible for the selection of all automotive and construction equipment. He would also be responsible for the maintenance of cost records of operation and repairs. He would have a general supervision over all shops and equipment used for the repair and maintenance of automotive and construction equipment. He would direct supervision of his office organization, shop foreman, and traveling inspectors.

A man qualified for this position would be familiar with [fol. 8425] all types of equipment used in construction, the normal costs of operation and maintenance of all types of automotive and construction equipment. He would also be required to be expert in cost accounting methods.

Clerks:

Two office clerks and one typist clerk would be required to maintain operating and repair cost records on the equipment in service.

Field Inspectors:

Three field or traveling inspectors would be employed for the purpose of making periodic checks on all equipment in service for the purpose of preventing serious break-downs. They would also report on all improper use of equipment, and instruct all operators with reference to the proper care of equipment.

The superintendent of plant and equipment would be employed three months prior to the beginning of construction, and the office clerks and inspectors would be employed one month prior to construction.

Division of Drilling and Production,

Superintendent of Drilling and Production:

The superintendent of drilling and production would be directly responsible for the letting of all drilling contracts, and would have responsible charge of all drilling operations.

In connection with actual field operations, he would be generally responsible for the setting of pipe and the finishing of wells, the ordering of material used in drilling operations, and the arranging for water and fuel. He would also be directly responsible for the letting of contracts for the construction of rigs and the handling of [fol. 8426] material.

In connection with the Geological Section, he would be responsible for the abandonment of drilling. He would be directly responsible for the routines of his office, the maintenance of drilling records and costs, and the direction of the personnel of the Division.

Assistant Superintendents:

In view of the fact that the reproduction program contemplates the completion of all producing gas wells owned by Lone Star Gas Company as of January 1, 1933, with the exception of the fifty eight wells assumed to have been completed prior to organization during a three and one-

half year period, it would be necessary to have three assistant superintendents in the field, one in direct charge of operations in West Texas, one in direct charge of operations in the Panhandle, and one in direct charge of operations in Southern Oklahoma. They would keep in constant contact with all drilling within their respective areas, keep the office advised as to progress and cost, and assist the foremen in direct charge of the individual rigs.

Clerk:

One office clerk would be required to maintain records and files, and assume responsible charge of the office routines during the absence of the superintendent of drilling and production.

Stenographer:

One stenographer would be required for the typing of progress reports and cost data, and for the maintenance of inter-departmental and outside correspondence.

The entire organization of the Division of Drilling and [fol. 8427] Production would be engaged from the date of incorporation to the end of the construction period.

Each of the superintendents would be men with a wide experience in the drilling for and production of gas, the care of wells after completion, and specific knowledge with reference to the problems encountered in the territories in which Lone Star Gas Company owns producing wells.

Division of Safety and Medical Examination

Supervisor of Safety:

The supervisor of safety would have general supervision over all safety activities and the physical examination of all prospective employees. He would also act as personal officer for the Construction Section. It would be his duty to select competent safety engineers, doctors and personnel men, provide the necessary equipment and supplies for carrying on all safety work and physical examinations, and provide the various construction crews with an adequate supply of labor.

Safety Engineers:

In addition to the supervisor of safety, three safety engineers would be employed. The safety engineers would be located at the most advantageous points where they could best serve the greatest number of employees. It would be their duty to make regular inspection of tools, equipment, and the work as it progressed, making suggestions and recommendations for the correction of or eliminating hazards, see that all first aid kits are kept stocked, to conduct safety meetings, and various other work which might arise in the course of construction work.

Chief Medical Examiner:

[fol. 8428] It would be the duty of the chief medical examiner to select, in co-operation with the supervisor of safety, the examining physicians, to detail and supervise their work, locating them so that they would be able to take care of the greatest number of men. It would also be the duty of the chief medical examiner to decide upon certain questions of a man's physical fitness in the event one of the junior or assistant examiners was unable to decide. In addition to the duties as outlined above, we would also expect for the chief medical examiner to go from place to place, as the occasion demanded, to examine small groups of men where the number would not justify the location of a resident or assistant examiner.

Examining Physicians:

Four examining physicians would be required. It would be the duty of the examining physicians to examine all prospective employees to determine their physical fitness for the work to be required of them, and to render first aid in case of accidents. We would not, however, require them to do more than render first aid to the injured, as the expense of all medical and hospital treatment is taken case of by the compensation insurance carriers. The examining physicians, as already mentioned, would be located at points where they would be able to take care of the greatest number of employees.

Personnel Man:

The personnel man will be in charge of all personnel records, will keep in touch with the various construction foremen, and keep them supplied with labor. It will be his duty to contact the Chamber of Commerce and employment bureau officials in the various towns along the proposed lines to secure their assistance in supplying local labor for the construction crews and to scout boarding house ac- [fol. 8429] com-odations for workmen.

Office Group:

One chief clerk and three stenographers would be required to maintain records, files and current correspondence.

The Division of Safety and Medical Examination would be organized one month prior to the beginning of construction.

Schedule of Salaries:

In fixing the salaries of the various responsible members of the Construction Section, consideration has been given to the obvious fact that each of them would necessarily be a man possessed of outstanding qualifications in his particular line of work. This fact is reflected in the unit costs of construction applied to the individual items of physical property in the section of this report dealing with the reproduction cost of the physical items. These costs have been based in a large measure upon the actual construction costs of Lone Star Gas Company. The organization responsible for these costs was secured by a process of the survival of the fittest extending over a period of twenty years.

In order to secure such an organization for the purpose of reproducing the property of Lone Star Gas Company within a construction period of three years, the personnels of other large companies would be drawn upon, and only the most competent men engaged. It would be impossible to develop and train such men as is normally done in companies in the process of gradual growth.

[fols. 8450-8458] Lone Star Gas Company

Appraisal

Cost of Reproduction New

January 1, 1933

Public Service Plant, Property and Business

Exclusive of Fort Worth Division

P. McDonald Biddison, E. A. Steinberger, Ed. C. Connor, Engineers, Dallas, Texas

[fol. 8459] The Relation Between Interest and Taxes During Construction and Fixed Charges on Inactive Plant (in Operation) During the Construction and Development Periods

[fol. 8460] In the preparation of this estimate of the reproduction cost of the property and business of Lone Star Gas

Company as of January 1, 1933, a careful study has been made of a hypothetical construction program, covering three years of actual construction that would conform to the logical process of placing the constructed plant in position to serve the center of gravity of the existing market at the earliest practical date. In the subsequent development of the estimates of the cost of Interest During Construction, Taxes During Construction, and the Cost of Business Development, effect has been given to the attachment of markets concurrently with the completion of the various sections of the physical property that would grow out of the application of the plan adopted.

The application of this plan to the estimate of the cost of the fixed charges, interest, taxes, and depreciation during the construction period, had the practical effect of reducing the estimated cost of Interest and Taxes during Construction substantially below the charges that would normally be estimated for these items in reproduction cost appraisals wherein less care had been exercised in determining the time at which specific markets would be attached as the section of the system when completed would pass from construction to operation.

Interest on the sum of money represented by advances for construction and all other expenses attributable to property under construction before the "coming into service" of the property under construction is a capital expense recognized by all regulatory bodies, and provision has been made for its capitalization in all standard uniform classification [fol. 8461] of accounts. The same is true of the cost of taxes (except certain special benefit assessments) levied on property under construction.

There is an extremely close relation between the cost of Interest and Taxes During Construction and the cost of interest, taxes and depreciation on that portion of the plant under construction that would come into service during the construction period, but that would, by reason of the inherent characteristics of the business, fail to be fully operative during a substantial period of time following the initiation of service. This relation will be developed in the subsequent analyses.

If the definition of Interest and Taxes During Construction used by the Interstate Commerce Commission and generally adopted for uniform classifications of accounts for

public utilities is interpreted to mean (and it is so interpreted) that interest and taxes cease to be proper capital charges as Interest During Construction and Taxes During Construction the instant of the "coming into service" of the property without regard to the extent of the use of the property at the time of its coming into service measured by its ultimate use, then it is obvious that some substitute capital charges must be provided to cover the accruals of fixed charges on inactive property during the period of business development in order to prevent substantial capital losses in properties subject to public regulation.

This fact can be clearly demonstrated by means of a comparative analysis of two assumed conditions, the second assumption being typical of actual conditions that would be met in the reproduction of any large natural gas pipe line system serving a large number of domestic consumers.

[fol. 8462] Assumption No. 1

Pre-construction Period	Six Months
Construction Period	Three Years
Cash requirements for construction and other expenses	
Pre-construction Period	5.00 Per Cent of total
First construction Year	40.00 Per Cent of total
Second construction Year	30.00 Per Cent of total
Third construction Year	25.00 Per Cent of total
Interest rate	8.00 Per Cent per Annum
Taxes	2.00 Per Cent per Annum

For simplicity of calculation, it will be assumed that the cash requirements will be secured at the beginning of each period, and that no earnings on unexpended balances would be credited to the interest account.

If it is further assumed that no portion of the property would become operative, or come into service until the end of the construction period, the calculation for Interest During Construction would be as follows:

5.00 Per Cent of total for 3.50 years at 8 Per Cent = 1.40%
40.00 Per Cent of total for 3.00 years at 8 Per Cent = 9.60%
30.00 Per Cent of total for 2.00 years at 8 Per Cent = 4.80%
25.00 Per Cent of total for 1.00 year at 8 Per Cent = 2.00%

Total Interest Charges on Total Expenditures 17.80%

In the case of Taxes During Construction the results of the calculation would depend upon the date at which construction is assumed to begin. For simplicity of calculation, it will be assumed that the construction period would begin July 1 of the Calendar year. Under this assumption, the calculated Taxes During Construction would be as follows:

25.00 Per Cent of total for 3.00 years at 2 Per Cent = 1.50%
60.00 Per Cent of total for 2.00 years at 2 Per Cent = 2.40%
87.50 Per Cent of total for 1.00 year at 2 Per Cent = 1.75%

Total Taxes on Total Expenditures 5.65%

[fol. 8463] The calculations for both Interest During Construction and Taxes During Construction are shown in graphic form as Graphic Illustration of the Application of Interest During Construction—Assumption No. 1, and Graphic Illustration of the Application of Taxes During Construction—Assumption No. 1.

Assumption No. 2

Pre-construction Period	Six Months
Construction Period	Three Years
Cash requirements for construction and other expenses	
Pre-construction Period	5.00 Per cent of Total
First construction Year	40.00 Per cent of total
Second construction Year	30.00 Per cent of total
Third construction Year	25.00 Per cent of total
Interest rate	8.00 Per cent per Annum
Taxes	2.00 Per cent per Annum
Depreciation (average)	5.00 Per cent per Annum
Per cent of plant in service at end of First Construction Year	40.00 Per cent of total
Per cent of plant in service at end of Second Construction Year	75.00 Per cent of total
Per cent of plant in service at end of Construction Period	100.00 Per cent of total
Per cent of plant inactive during Second Construction Year	85.00 Per cent of total
Per cent of plant inactive during Third Construction Year	65.00 Per cent of total

Inasmuch as only forty per cent of the total plant has been assumed to have passed into service at the end of the first

construction year, the percentage of the total plant inactive during the second construction year, in terms of plant in service, would be forty per cent minus fifteen per cent, or twenty five per cent of the total plant.

Inasmuch as only seventy five per cent of the total plant has been assumed to have passed into service at the end of the second construction year, the percentage of the total [fol. 8464] plant inactive *inactive* during the third construction year, in terms of plant in service would be seventy five per cent minus thirty five per cent, or forty per cent of the total plant. Under the conditions outlined in Assumption No. 2, the calculation for Interest During Construction would be as follows:

5.00 Per cent of total for 1.50 years at 8 per cent =	.60%
40.00 Per cent of total for 1.00 year at 8 per cent =	3.20%
35.00 Per cent of total for 1.00 year at 8 per cent =	2.80%
25.00 Per cent of total for 1.00 year at 8 per cent =	2.00%
Total Interest Charges on Total Expenditures	8.60%

The calculation for Taxes During Construction upon the assumption that construction would begin July 1, of the Calendar year would be as follows:

25.00 Per cent of total for 1.00 year at 2 per cent =	.50%
20.00 Per cent of total for 1.00 year at 2 per cent =	.40%
12.50 Per cent of total for 1.00 year at 2 per cent =	.25%
Total Taxes on Total Expenditures.....	1.15%

The calculations for both Interest During Construction and Taxes During Construction are shown in graphic form as Graphic Illustration of the Application of Interest During Construction—Assumption No. 2, and Graphic Illustration of the Application of Taxes During Construction—Assumption No. 2.

It has been previously determined for Assumption No. 2 that for the portion of the plant "passing into service" at the beginning of the second construction year, such a proportion would be inactive compared to ultimate domestic use, as to be equal to twenty five per cent of the total plant. For the portion of the plant passing into service at the beginning of the third construction year, together with the portion that passed into service during the previous year,

uch a portion would be inactive, compared to ultimate do-
nestic use, as to equal forty per cent of the total plant.
fol. 8465] These percentages were determined by the ap-
lication of the normal percentage of the ultimate customer
aturation and customer use (domestic basis) that would be
cquired during the first and second year of natural gas
ervice to the per cent of the total plant in service in the
econd and third construction years.

Therefore, for the second and third construction years,
here would be an aggregate of sixty five per cent of the
otal plant that would be inactive (one year basis) and upon
vhich no charges for interest and taxes during construc-
ion would be set up as capital items under the accepted
lefinition of these items.

This situation is set out in graphic form as Graphic Illus-
ration of the Relation of Inactive Plant to Plant in Service,
Construction Period Only—Assumption No. 2.

It will be clear from the foregoing analyses that unless
ome provision is made in the reproduction cost estimate to
over the fixed charges, which in the case of operative prop-
rty include depreciation as well as taxes and interest, on
his proportionate part of the cost of the total property
vhich has passed from construction into service but which
n reality is operative only to a limited degree, then the esti-
nate to this extent fails to reflect the actual reproduction
ost.

The proper calculations to cover this cost (construction
eriod only) under the conditions set out in Assumption No.
2 are as follows:

Second Construction Year

Interest	8 Per cent of 25 per cent—one year	= 2.00 Per cent.
Taxes	2 Per cent of 25 per cent—one year	= .50 Per cent.
Depreciation	5 Per cent of 25 per cent—one year	= 1.25 Per cent.

[fol. 8466] Third Construction Year

Interest	8 per cent of 40 per cent—one year	= 3.20 per cent.
Taxes	2 per cent of 40 per cent—one year	= .80 per cent.
Depreciation	5 per cent of 40 per cent—one year	= 2.00 per cent.
Fixed Charges on Total Expenditures*		9.75 per cent.

* Theoretically in service but actually inactive during the construction period.

The discussion up to this point has dealt with the fixed charges upon the proportionate part of the total plant that would have passed into service, but that would have been

inactive during the construction peirod only. The same methods and the same reasoning would apply to the proportionate part of the total plant that would be in service, but partially inactive during the years immediately following the completion of construction. The ratio of the inactive plant to the total plant would decrease by successive steps as the business existing at the date of the reproduction cost estimate would gradually be acquired. However, the fixed charges, interest, taxes and depreciation, on the inactive portion of the total plant during this time would be an inescapable part of the cost of reproduction, and should therefore be made a part of any estimate that fully reflects the actual costs that would be encountered in reproduction.

In fixing the estimated amounts for the closely inter-related elements of cost, interest and taxes on property wholly in construction and interest, taxes and depreciation on the inactive part of plant in service during the construction and development periods, care should be exercised to avoid any hypotheses or assumptions that would not conform to the logical processes of construction and business acquisition applicable to the particular property being appraised.

[fol. 8467] As stated at the beginning of these analyses, and as will be developed in the detailed estimates of the cost of Interest During Construction, the cost of Taxes During Construction, and the cost of Business Development in the subsequent sections of the appraisal, the conditions assumed conform as nearly as is practicable in a reproduction cost estimate to the conditions that would be met in the reproduction of the property and business of Lone Star Gas Company as of January 1, 1933.

In concluding this general discussion preliminary to the detailed estimates of the costs of the fixed charges that are included in the subsequent section of the report, consideration will be given to certain basic factors that have a direct bearing upon the methods employed.

A natural gas pipe line system, with the exception of certain items that constitute a relatively small proportion of the system as a whole, should be initially designed and constructed to meet the anticipated demands of the market served. The use of such a program would necessarily result in a substantial part of the constructed system being inactive during the period in which the anticipated demands of the market were being developed. This condition would be emphasized where the anticipated demands would be, in

a large measure, the cumulative demands of a large number of individual domestic consumers.

The ultimate cost of such a program, after giving full effect to the proper capitalization of the fixed charges on the inactive portion of the system during the period of business acquisition, would be substantially less than the ultimate cost of a system built by the installation of units of [fol. 8468] property commensurate with the existing demand at the date of installation. A specific example will clarify this statement.

Under similar conditions the cost installed of steel pipe four inches in diameter would be approximately one fourth the cost installed of steel pipe sixteen inches in diameter. The delivery capacity of the four inch pipe with equal length of line and equal intake and discharge pressures for each size pipe, would be approximately one thirty fifth the delivery capacity of the sixteen inch pipe. There is little variation from the rule that the installed cost of steel pipe increases directly with diameter increase, while the delivery capacity increases with the 2.667th power of the diameter increase.

On account of this basic engineering fact, natural gas pipe line systems serving large domestic markets are constructed with initial capacities largely in excess of initial demands and reproduction cost estimates that reflect normal conditions must give effect to this fact.

Initial domestic rates for natural gas service could not be fixed at a price that would yield the pipe line company interest, taxes and depreciation above the variable operating charges on the cost of those portions of the property "passing into service" with only a relatively small proportion of their capacity absorbed by the demands of the service. High initial rates would discourage use and delay the date of ultimate saturation. For this reason, the domestic rates assumed in the appraisal are identical with domestic rates in force at the date of the appraisal and the loss of fixed charges on the proportionate part of the plant estimated to be inactive at the various stages of the development period has not been adjusted to give effect to any [fol. 8469] modified rate schedules.

(Note.) All percentages used in the calculations are hypothetical and have been assumed for the purpose of illustration and ease of calculation.

[fols. 8475-8478] Expenditures by Periods

* * * * * * *

[fol. 8479] In order to arrive at an estimate of the cost of Taxes During Construction, Interest During Construction, and Fixed Charges on Idle Plant, three basic determinations must be made.

1. The amount of expenditures that would be made in the reproduction of Lone Star Gas Company During the Pre-Construction Period, and during each of the construction years

2. The proper classification of these expenditures by investment accounts

3. The proportionate amount of the total reproduction cost that would pass into service during the construction period

It has been previously stated that in the preparation of this estimate, a careful study has been made of logical construction program that would be followed in reproduction. The essential details of the hypothetical construction program that was developed as a result of this study are shown in the three maps which for convenience and reference, are again introduced into the body of the report.

The estimated reproduction cost of each element of the physical property included in the program for each yeas has been set out in detail and made a part of the construction cost for each year. In this section of the report which deals strictly with Preliminary Development and Organization Costs, Undistributed General Costs, and Going Value, the costs attributable to the various undistributed expenses have been properly allocated to the Pre-Construction period, and the construction years.

With reference to the various items of physical property, the major items, the reproduction cost of transmission, tap and gathering lines and equipment, and compressor stations, equipment and land, have been analyzed in detail and the [fol. 8480] proportionate amount allocated to each construction year in conformity with the construction program. Other items such as the value of gas leases and reserves, and the reproduction cost of gas well construction and equipment have, insofar as that portion of the reproduction cost is attributable to the construction period, been equally divided

between the three years. This allocation is in conformity with the normal procedure that would occur in reproduction.

Of the general costs, marketing costs have been allocated to each period in proportion to the total expenditures in each period.

The necessity for the classification of these expenditures by investment accounts grows out of the fact that while Interest During Construction would be fixed by the date and the amount of expenditures without reference to their classifications, Taxes During Construction would accrue largely upon the basis of the cost of the physical property installed as distinguished from concurrent expenditures for Undistributed General Costs.

The necessity for the determination of the proportionate amount of the total reproduction cost that would pass into service at intervals during the construction period grows out of the fact that both Taxes During Construction and Interest During Construction would cease insofar as the property items passing into service were concerned, and would be superseded by the corresponding charges on the portion of this plant in service but inactive or idle during the period of business development.

It will be noted from an inspection of the schedule that all Preliminary Development and Organization Costs, with the exception of the marketing costs of securities are estimated [fol. 8481] to have been incurred in the Pre-Construction Period, and that certain other capital expenditures as the cost of the General Office Land and General Office Structure have also been ascribed to the same period. These expenditures would be an essential part of the cost of the system as a whole. For this reason, in fixing the reproduction cost of the property going into service at the end of the First Construction Year, and at the end of the Second Construction Year, the costs incurred in the Pre-Construction Period have been allocated and added to these construction period costs in proportion to the total costs incurred in the First and Second Construction Periods respectively, to the total costs incurred during the entire construction period.

From the Schedule of Expenditures by Periods, the following determinations have been made:

Taxes During Construction

After deducting from Direct Structural Costs the items included in the Pre-Construction Period on which taxes have

been included in Other General Costs, the taxable expenditures were found to be as follows:

Pre-Construction Period	$3,049,057
Construction Period—First Year	20,519,270
Construction Period—Second Year	17,485,239
Construction Period—Third Year	9,128,368
Total	$50,181,934

These amounts have been used in the calculation of Taxes During Construction.

Interest During Construction

From the Schedule of Expenditures by Periods, including the distributed calculation of Taxes During Construction, the [fol. 8482] total expenditures by periods was found to be as follows:

Pre-Construction Period	$6,895,832
Construction Period—First Year	22,673,380
Construction Period—Second Year	19,326,719
Construction Period—Third Year	10,617,053
Total	$59,512,984

In order to determine the amount of these expenditures that would pass into service at the end of the First and Second Construction Years, the following steps were taken:

1. The percentage of the total amount included in the construction period, $52,617,152, was determined for the expenditures made in each construction year

$$\frac{22,673,380}{52,617,152} = 43.09\%$$

$$\frac{19,326,719}{52,617,152} = 36.73\%$$

$$\frac{10,617,053}{52,617,152} = 20.18\%$$

2. These percentages were then applied to the expenditures made in the Pre-Construction Period for the purpose of distributing these expenditures to the property going into service during the Construction Period.

The application of these percentages resulted as follows:

Pre-Construction expense attributable to First-Construction Year	$2,971,414
Pre-Construction expense attributable to Second-Construction Year	2,532,839
Pre-Construction expense attributable to Third-Construction Year	1,391,579

The application of these calculations is shown in detail in Interest During Construction.

Fixed Charges on Idle Plant

As shown by the Schedule of Expenditures by Periods, the total reproduction cost of the property including Interest During Construction was found to be $64,488,917, and the expenditures by periods as follows:

[fol. 8483] Pre-Construction Period	$7,171,665
Construction Period—First Year	24,817,147
Construction Period—Second Year	21,012,426
Construction Period—Third Year	11,487,679
Total	$64,488,917

In order to estimate the percentage of this total expenditure that would pass into service at the end of the First and Second Construction Periods, the following step was taken:

The sum of the expenditures during the three construction periods was:

$$\frac{24,817,147}{57,317,252} = 43.30\%$$

$$\frac{21,012,426}{57,317,252} = 36.66\%$$

$$\frac{11,487,679}{57,317,252} = 20.04\%$$

It is estimated that the above percentage of the total expenditures, $64,488,917, would pass into service successively at the end of each construction period. The application of these calculations is shown in detail in the development of Fixed Charges on Idle Plant.

[fol. 8513] Taxes During Construction

General Summary

Construction Period—First Year	$80,042
Construction Period—Second Year	52,577
Construction Period—Third Year	27,466
Post Construction Period	13,733
Total	$173,818

[fol. 8514] Definition:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company as of

January 1, 1933, Taxes During Construction is intended to include all State, County, Township, City, School, Road, Annual franchise, and all other taxes that would be levied and paid on the property of the company during construction and before the facilities would be used for operation, except special benefit assessments.

Taxes Paid:

For the year 1932, Lone Star Gas Company paid or accrued ad valorem taxes in the amount of $299,676, corporation license fees of $3,395 in the State of Oklahoma, and franchise taxes of $17,784 in the State of Texas. These amounts include the ad valorem taxes, license fee and franchise taxes on the non-public service as well as the public service property of the company. Based upon an analysis made of the ratio of public service property of the company to its non-public service property, it has been determined that 96.4 per cent of taxes paid or accrued by Lone Star Gas Company in 1932 were attributable to its public service property. The total ad valorem taxes, license fees and franchise taxes paid or accrued by Lone Star Gas Company in 1932, and attributable to its public service property were as follows:

Ad valorem taxes	$288,888
Franchise tax (Texas)	17,144
Corporation license fee (Oklahoma)	3,273
Total	$309,305

[fol. 8515] Included in the estimate of Other General Costs were the following ad valorem taxes:

General Office and General Office Structure	$6,851
Other General Land (Parking Lot)	288
Furniture and Fixtures	346
Total	$7,485

Deducting this total from $309,305 there remains $301,820 as the annual tax factor to be used in the calculation of Taxes During Construction.

Bases of the Estimate:

Any calculation of Taxes During Construction for a property in reproduction will be controlled by the following factors:

1. Total taxes attributable to a property in construction paid upon the completed plant at the date of inquiry.

2. The rate at which the property subject to taxation would be constructed.

3. The date at which construction is assumed to have been started.

4. The rate at which the property subject to taxation in construction passes into service during the construction period.

Factor I:

The total taxes paid by Lone Star Gas Company and attributable to the property in construction have been previously fixed at $301,820 per annum.

Factor II:

In the analysis of total expenditures by periods, a complete break down has been made of the rate at which the various items of the property would normally be constructed in reproduction. Also a distribution has been made by con- [fol. 8516] struction periods of the incurrence of the undistributed general costs, with the exception of Taxes During Construction and Interest During Construction, which items are in a measure dependent upon the results of the primary analysis.

The major portion of the taxes attributable to construction and paid or accrued by the company in the sum of $301,820, is based upon the value of the physical elements of the property as distinguished from elements of value represented by Undistributed General Costs. For this reason, the direct structural costs, together with the reproduction costs of the physical items subject to taxation found in each construction period have been used for the basis for the calculation of Taxes During Construction.

From the analysis of estimated expenditures by periods, the following data has been secured:

Defendant's Exhibit No. 28—Continued

Physical Property—Pre-Construction Period	$3,049,057
Physical Property—Construction Period—First Year	20,519,270
Physical Property—Construction Period—Second Year	17,485,239
Physical Property—Construction Period—Third Year	9,128,368
Total	$50,181,934

(NOTE.) From the physical property Pre-Construction Period, General Office Land, General Office Structure, Parking Lot, and Furniture and Fixtures have been deducted. The taxes on these items have been included in Other General Costs.

Per cent of Total—Pre-Construction Period	6.08
Per cent of Total—Construction Period—First Year	40.89
Per cent of Total—Construction Period—Second Year	34.84
Per cent of Total—Construction Period—Third Year	18.19

Factor III:

It is evident that by a manipulation of the date at which it is assumed that construction would be started, it would be possible to materially affect the estimate of the costs of Taxes During Construction. The fairest and most logical method of approach to a solution of the problem is to as- [fol. 8517] sume that actual construction would begin July 1, and that the taxable property would be installed at a uniform rate thereafter.

Factor IV:

In conformity with the classification of investment accounts prescribed by the Interstate Commerce Commission, this estimate of Taxes During Construction is based upon the assumption that Taxes During Construction would cease to be proper charges to investment whenever the property subject to taxation would in the normal progress of reproduction, pass from property in construction to property in operation. This has been done without consideration of the percentage of the plant designated as operative

that would be idle or inactive with reference to its capacity for service or its actual service performance at the date of inquiry.

This basic assumption necessitates the determination of the rate at which the property in construction would pass into partial operation. As will be more fully developed in the discussion of Going Value, or the Cost of Fixed Charges on Idle Plant, it has been assumed that the property constructed during the first construction year would become operative at the beginning of the Second Construction Year; that the property constructed during the Second Construction Year would become operative at the beginning of the Third Construction Year, and that at the end of the third Construction Year the property would be wholly operative. These assumptions have no reference to the percentage of such portions of the plant as are deemed to be operative that would in fact be idle, and therefore idle or non-operative from the standpoint of earning fixed charges.

From the previous determination of the percentage of [fol. 8518] taxable property completed in each period, and in conformity with the assumption that construction would begin July 1, and would be carried on uniformly thereafter, the following estimate has been made:

Pre-Construction Period:

Begun January 1.		
Taxable Expenditures for the Period		$3,580,178
Less:		
General Office Structure	$321,438	
General Office Land	44,545	
Parking Lot	18,052	
Furniture and Fixtures	147,086	531,121
Total Taxable Expenditures as of July 1 Beginning of First Construction Year		$3,049,057

Construction Period—First Year:

Begun July 1	
Taxable Expenditures Pre-Construction Period	$3,049,057
Taxable Expenditure for the Period	20,519,270
	23,568,327

Defendant's Exhibit No. 28—Continued

Less:		
One half Expenditure for the Period		10,259,635
Total Taxable Expenditures Applicable to Taxes During Construction January 1, First Construction Year		$13,308,692
Per cent of Total Taxable Property		26.52
Construction Period—Second Year:		
Begun July 1		
Taxable Expenditures Pre-Construction Period		$3,049,057
Taxable Expenditures First Construction Year		20,519,270
Taxable Expenditures for the Period		17,485,239
		41,053,566
Less:		
One half Expenditures for the Period	$8,742,620	
Taxable Expenditures Property Operative	23,568,327	32,310,947
Total Taxable Expenditures Applicable to Taxes During Construction January 1, Second Construction Year		$8,742,619
Per cent of Total Taxable Property		17.42
[fol. 8519] Construction Period—Third Year:		
Begun July 1.		
Taxable Expenditures Pre-Construction Period		$3,049,057
Taxable Expenditures First Construction Year		20,519,270
Taxable Expenditures Second Construction Year		17,485,239
Taxable Expenditures for the Period		9,128,368
		$50,181,934
Less:		
One half Expenditures for the Period	$4,564,184	
Taxable Expenditures Property Operative	41,053,566	45,617,750

Defendant's Exhibit No. 28—Continued

Total Taxable Expenditures Applicable to Taxes During Construction January 1, Third Construction Year	$4,564,184
Per cent of Total Taxable Property	9.10

Post-Construction Period:

During the first year following the completion of construction which in this estimate is assumed to have taken place on July 1, taxes would be paid on the property of the company as of January 1, which in this case would be the total property found by the reproduction cost estimate. Of the taxes paid on the property as of January 1, following completion of construction, the taxes accrued during the last six months of construction would have accrued in part upon the average property in construction during the six months period. Expressed in terms of taxable property for one year, this would be one-fourth of the taxable property in the Third Construction year, or $2,282,092, or 4.55 per cent of the total taxable property.

Upon figures from the foregoing calculation, it has been determined that an equivalent of 57.59 per cent of the total taxable property would have accrued taxes as property in [fol. 8520] construction. The application of this percentage to the sum $301,820 results in a total cost of Taxes During Construction of $173,818, distributed as follows:

First Construction Year, 26.52% of $301,820	$80,042
Second Construction Year, 17.42% of 301,820	52,577
Third Construction Year, 9.10% of 301,820	27,466
Post-Construction Period, 4.55% of 301,820	13,733
Total	$173,818

[fols. 8522-8523] Interest During Construction

Summary

Pre-Construction Period	$275,833
Construction Period—First Year	2,143,767
Construction Period—Second Year	1,685,707
Construction Period—Third Year	870,626
Total	$4,975,933

[fol. 8524] Interest During Construction

Definition:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company, Interest During Construction is intended to cover the cost of interest on all expenditures that would be made in connection with the reproduction of the corporate entity, and the physical property together with the expenditures for undistributed general costs, from the date of the incorporation of the company until such time as the property items representing these expenditures would pass from construction to operation.

In the classification of investment (fixed capital account) in road and equipment of steam roads prescribed by the Interstate Commerce Commission, Interest During Construction is defined as follows:

"When any bonds, notes, or other evidences of indebtedness are sold, or any interest-bearing debt is incurred for acquisition and construction of original road and equipment, extensions, additions, and betterments, the interest accruing on the part of the debt representing the cost of property chargeable to road and equipment accounts (less interest, if any, allowed by depositaries on unexpended balances) after such funds become available for use and before the receipt or the completion or coming into service of the property so acquired shall be charged to this account.

When such securities are sold at a premium, the proportion of such premium assignable to the time between the date of the actual issuance of the securities and the time when the property acquired or the improvement made be-

comes available for service shall be credited to this account.

This account shall also include such proportion of the [fol. 8525] discount and expense on funded debt issued for the acquisition of original road, original equipment, road extensions, additions, and betterments, as is equitable assignable to the period between the date of the actual issuance of securities and the time when the property acquired or the improvement made becomes available for the service for which it is intended. The proportion of discount and expenses thus chargeable shall be determined by the ratio between the period prior to the completion or coming into service of the facilities or improvements acquired and the period of the entire life of the securities issued.

This account shall also include reasonable charges for interest, during the construction period before the property becomes available for service, on the carrier's own funds expended for construction purposes."

Basic Factors of the Estimate:

In the calculation of Interest During Construction, insofar as this element of expense would be incurred in the reproduction of the Property of Lone Star Gas Company as of January 1, 1933, the following basic factors would be involved:

1. The time assigned to the pre-construction, construction, and post-construction periods.

2. The rate of interest charged for funds advanced for construction and other expenditures.

3. The requirements of the fiscal agents with reference to the sums advanced at stated intervals.

4. The amount of interest earned on unexpended balances.

5. The time at which expenditures would be made from the date of incorporation until such time as expenditures would not be attributable to construction.

[fol. 8526] 6. The rate during the period of construction at which the various elements of property would become operative.

(1.) Time assigned to the pre-construction, construction and post-construction periods.

The pre-construction period has been fixed at six months and includes the time from date of incorporation to the time at which actual construction would begin.

The construction period has been fixed at three years and includes the time from the beginning of actual construction to the time at which the physical elements of the property would be complete.

The post-construction period has been fixed at six months and includes the time from the end of construction to the time when engineering, accounting and other records attributable to construction would be complete.

The duration of each of the foregoing periods has been determined as the minimum time that would be required in which to economically do the work that would necessarily be done in connection with the reproduction of the property of Lone Star Gas Company as of January 1, 1933.

(2.) The rate of interest charged for funds advanced for construction and other expenditures.

In fixing the rate of interest that would be paid for funds advanced for construction and other expenditures in the reproduction of Lone Star Gas Company, consideration must be given to several factors that would have a direct bearing upon the rate paid.

(a) In a reproduction cost estimate the rate should be based not on the financial credit of the property at the time of the appraisal but on the assumption that the property is a new property and without operating history.

[fol. 8527] (b) Consideration must be given to financial conditions existing at the date of the appraisal. In fixing the unit costs of the various elements of the physical property, consideration has been given to the current market prices for both labor and materials. There is a close relation between the downward trend of commodity prices and the upward trend of the cost of money. It would be irrational in an estimate of this character to give effect to spot prices for the materials of construction without giving some weight to the current cost of money. In this estimate no attempt has been made to give full effect to the unusual financial conditions existing as of January 1, 1933. Nevertheless, interest rates that might have been applicable during the years preceding 1929 could not be used as the basis for an estimate at the date of this appraisal.

1951

(c) Consideration must be given to the financial structure adopted provided this financial structure conforms to that, which in practice, would result in the minimum cost of money to the company.

In the analysis of Preliminary Development and Organization Costs, it was assumed that 50% of the total money required by the company would be secured from sale of mortgage bonds, 25% from the sale of preferred stock, and 25% from the sale of equity stock. This structure or financial plan is one that would be favorable to the company, particularly in view of the fact that it has been assumed that the equity money would be provided by the originating group.

The following tabulation sets out the estimated cost of [fol. 8528] money to the company (interest basis) using the financial structure above outlined.

Type of Security	Rate	Net to Company	Rate	Weighted Rate
50% bonds	6.5%	90	7.22%	3.61%
25% preferred	8.0%	90	8.89%	2.22%
25% common	10.0%	Par	10.00%	2.50%
Weighted Average Annual Rate				8.33%
Annual Rate Adopted				8.00%

The rate adopted for the purpose of calculating Interest During Construction does not give full effect to financial conditions existing at the date of the appraisal. It would have been impossible at that time, and it would be impossible now to secure funds for any new natural gas enterprise upon terms as favorable as those used in the calculation of the interest rate adopted.

(3.) The requirements of the fiscal agents with reference to the sums advanced at stated periods.

In the construction of large projects such as Lone Star Gas Company, funds must be provided well in advance of immediate requirements. In many cases the fiscal agents require of the Company the assumption of the entire issue before any advances will be made. In this estimate an extremely favorable condition, from the standpoint of cost to the company, has been assumed. As one of the bases for the calculation of Interest During Construction, it has been assumed that an amount representing the estimated ex-

penditures for each successive period of construction would be advanced by the fiscal agents. Under present financial conditions this is the most favorable arrangement that could be made.

(4.) Amount of interest earned on unexpended balances.

It is evident that a certain proportion of advances cover- [fol. 8529] ing the estimated expenditures for the Pre-Construction Period, the three construction years, and the Post-Construction Period would remain unexpended during a portion of the time. In order to provide for this fact, it has been assumed that for each advance, except that provided for the Pre-Construction Period, 75 per cent of the total sum would remain as an unexpended balance for three months; that 50 per cent would remain as an unexpended balance for three months, and that 25 per cent of the total sum advanced would remain as an expended balance for three months. It is further assumed that interest would be allowed at the rate of two per cent per annum on the amounts represented by unexpended balances, and that such interest as would accrue from this source would be credited to the cost of Interest During Construction. This allowance of two per cent per annum on unexpended cash balances has not been borne out by recent experience of Lone Star Gas Corporation in its fiscal arrangements.

Exception to the above method has been made in the case of the advances for the Pre-Construction Period for the reason that a very large proportion of the expenditure attributable to this period would be made immediately upon the perfection of corporate organization. All of the preliminary and organization costs, including the remuneration of the services of the originating group, would be liquidated immediately upon incorporation, and the general office building and general office land would be acquired immediately thereafter.

In the subsequent construction years, the rate of expenditure would be fairly uniform during each year, and no material error will grow out of the assumption that such would be the case.

[fol. 8530] The money required for Post-Construction expenses has been included in the expenditures of the last construction year.

(5) The time at which expenditures would be made from the date of inforporation until such time as expenditures would not be attributable to construction.

As previously developed under Expenditures by Period, the total expenditures, $59,512,984, would be divided by periods as follows:

Pre-Construction Period	$6,895,832
Construction Period—First Year	22,673,380
Construction Period—Second Year	19,326,719
Construction Period—Third Year	10,617,053

The expenditures during the Pre-Construction Period were allocated to the construction period as follows:

Construction Period—First Year	$2,971,414
Construction Period—Second Year	2,532,839
Construction Period—Third Year	1,391,579

Calculation

Pre-Construction Period

Taxes	435,044
Personnel Costs	200,000
	$11,789,068
Less:	
Credits for Net Industrial Revenue	3,996,180
Total	$7,792,888

[fol. 8535] Going Value Based on Reproduction Cost of Business Development

Definitions:

As used in this estimate of the reproduction cost of the property and business of Lone Star Gas Company as of January 1, 1933, Going Value is intended to cover the reproduction cost of those elements of worth or value not developed by an appraisal of the physical property, but inherent in the property and business of the company as of that date by reason of the following facts:

1. That approximately 230,000 domestic consumers received their supply of natural gas from the facilities afforded by the property of Lone Star Gas Company.

2. That these domestic consumers by the purchase of equipment and appliances representing an investment of more than $40,000,000 and by a knowledge of the value of natural gas service, acquired over a period of years, had developed an average annual consumption of approximately 80 M cubic feet per domestic meter installed.

3. That approximately 1,400 industrial consumers with diversified requirements received their fuel supply from the facilities afforded by the property of Lone Star Gas Company, and that the annual sales resulting from this use was approximately 15,000,000 M cubic feet.

4. That in addition to the active industrial accounts, other large industrial consumers were attached to the company's system. That those consumers had the equipment required for the use of natural gas installed at their plants, were familiar with the use and advantages of natural gas, and had temporarily discontinued the use of natural gas solely on account of unusual conditions in the fuel market.

5. That the company by the purchase and development of leases and by the consummation of advantageous gas purchase contracts, had available to its transportation system a supply of gas substantially in excess of the present maximum requirements of its markets. That this supply of gas was highly diversified with reference to the load center of the market as to assure economical transportation to the market.

[fol. 8536] 6. That the company over a period of more than twenty years had developed a highly trained and efficient operating personnel consisting of executives, counsel, technicians, departmental heads, and other employees familiar with all phases of the natural gas business. That such a trained organization had peculiar value by reason of the fact that the natural gas business is not a universal utility service such as water, light and power, transportation, or telephone service, but is confined to specific geographic areas and the supply of experienced gas executives and technicians is therefore limited and correspondingly difficult to secure.

7. That the company over a period of more than twenty years operating experience had developed and had in use efficient operating routines. That valuable operating records and statistical and technical data has been accumulated and that such routines, records and data were specifically applicable to the property and business of Lone Star Gas Company.

8. That by the application of rate schedules for the sale of domestic gas that would have been less than the value of the services and would not have encountered the application of the law of diminishing returns, the company could have earned in addition to operating charges a reasonable return on the value of its property determined by this appraisal including the estimate for Going Value and a proper

annual allowance to cover depreciation, amortization, dry hole expense, and cancelled and surrendered leases.

Of the foregoing, items 1 to 7, inclusive, may be defined as the specific elements that contributed to and in the aggregate made up the Going Value of Lone Star Gas Company as of January 1, 1933.

From the standpoint of a reproduction cost estimate of the property and business of the company, these items can be evaluated upon the basis of what it would have cost a new company identical with Lone Star Gas Company insofar as all of its physical elements were concerned to have secured the trained operating personnel, established the efficient operating routines, and acquired the volume of sales of Lone Star Gas Company as of January 1, 1933.

Item 8 may be defined as the factor that establishes the propriety of attributing value to these costs as well as to the cost of reproducing the physical property. This is true [fol. 8537] for the reason that the value of a utility property, no matter what the cost of reproduction may be, can never be greater than that sum, expressed in dollars, upon which the utility can earn its return and depreciation through the application of rates for its service that do not exceed the value of that service.

In this connection the converse is also true, and the existence of Going Value cannot be denied by reason of the fact that earnings are inadequate under rate schedules that are substantially below the value of the service and are substantially less than those that might bring into operation the law of diminishing returns.

Basic Assumptions:

In the estimate, the costs that would be incurred in reproduction in connection with items 5, 6 and 7 have been included in Preliminary Development and Organization and Undistributed General Costs.

The inclusion in the appraisal of the physical property of gas leases and rights at their fair market value, and the inclusion in the preliminary and undistributed costs of the cost of a geological and a land and lease personnel that would be able within the comparatively short time ascribed to the preliminary development construction periods, to reproduce the geological records and data, and secure the land

and leases of Lone Star Gas Company as of January 1, 1933, provides in a general way for the cost of consolidating the gas supply.

The estimated cost of securing a trained personnel for the construction period will be developed in a subsequent section of the report. All construction costs used in the [fol. 8538] development of the unit costs of the physical property have been based upon the supervision of the work by the trained executive and supervisory organization of Lone Star Gas Company. The organization was secured and trained over a twenty three year operating and construction experience. That it would cost a substantial sum of money to assemble and organize this type of executive and supervisory personnel is obvious.

It seems reasonable to assume in this connection that this personnel would gradually change in its functions as the property passed from construction to operation, and that during the three and one half years ascribed to construction and preliminary work that such an organization would develop efficient operating routines.

The cost of reproducing the final engineering records of Lone Star Gas Company as of January 1, 1933 has been specifically appraised and included as a part of Direct Structural Costs and the estimated cost of the collection of geological records has been included under Administration and Legal Costs.

It is certain that the adoption of the methods above outlined, and which seemed the most practical in this case, has resulted in use of a figure that fails to represent the full value of the elements under consideration. The value to a going concern of a group of highly trained men, most of whom have had the advantage of having been associated with the property over a long period of time, and who have by this association acquired an intimate knowledge of every phase of its affairs, cannot be adequately appraised by the estimated cost of securing the services of hypothetical substitutes.

[fol. 8539] With these elements of cost and value elsewhere provided for in the estimate, there remains the problem of fixing the value as of January 1, 1933 of the factors included in items 1, 2, 3 and 4 as set out under Definitions. These four items, as factors contributing to the value of Lone Star Gas Company have to do with the value of a busi-

ness of the company as distinguished from the value of its physical property. In conformity with the plan of fixing the present value of the physical property by means of the estimated cost of its reproduction, the present value of the business has been determined by the estimated cost of reproducing it.

A basic assumption of all reproduction cost estimates of physical property is that the property is non-existent at the date of the appraisal. A direct corollary of this basic proposition is the assumption that the business that has been created as the direct result of the historical operations of the company is non-existent at the date of the appraisal.

In the subsequent calculations, it has been assumed that the business of Lone Star Gas Company that has been the result of the operations of Lone Star Gas Company as a marketing agency for the sale of natural gas was non-existent at the initiation of the project in reproduction.

Any utility property in operation must meet three so-called fixed charges. They are so designated in order to distinguish them from the more or less fluctuating costs of operation and for the further reason that the amount of the accruals to meet these charges has little or no relation to the volume of business done by the company. These so-called fixed charges are:

[fol. 8540] 1. Return on over-all cost of the property.

2. Depreciation on the depreciable property.

3. Ad Valorem taxes.

(1) Return:

The instant that a property item passes from construction into operation, Interest During Construction as applied to the over-all cost of this item ceases to be a proper charge to capital account. The changed status of this property item from an item in construction to an item in operation in no way affects the continuity of the interest charge if mere interest alone is to be considered. In the case of a going concern, this interest charge becomes a reasonable return for the use of the property and is therefore greater than mere interest inasmuch as it must also cover the reward for operation and management. It is also true that the volume

of business handled by this item of property affects neither the continuity nor the amount of this charge.

(2) Depreciation:

The instant that a property item passes from construction to operation, depreciation accruals must be set up if the lessening worth of the item is to be offset and the liability for its ultimate replacement met. Unlike properties in which depreciation is, in a measure, a function of amount of use to which the equipment is put (street railways and the like) the depreciable property of a natural gas pipe line company suffers physical depreciation without regard to the amount [fol. 8541] of business done. This statement does not apply to the depletion of gas reserves and the charges for amortization and abandonment that must be accrued on account of the depletion of reserves.

(3) Taxes:

The instant that a property item passes from construction into operation, Taxes During Construction as represented by the taxes attributable to this item ceases to be a proper charge to capital account. As in the case of return, the liability of the owner for the payment of taxes and the necessity for an accrual to meet this payment is in no way affected by the changed status of the property item. It is also true that the amount of the tax attributable to this property item would be fixed on taxable value, and not upon the volume of business handled.

It is evident from the foregoing analysis that in connection with the reproduction of Lone Star Gas Company within the three year period ascribed to construction, certain elements of the physical property would pass from construction into limited operation during the construction period, and at the end of the construction period the entire plant would become operative. It is also evident that the sum of the three fixed charges would begin to accrue upon the cost of the proportionate part of the plant passing into operation during the construction period, and upon the cost of the entire plant at the end of the construction period.

If the business of Lone Star Gas Company was nonexistent at the date of the initiation of the project, it would [fol. 8542] have been impossible for the property in reproduction to have developed and acquired the business of

Lone Star Gas Company as of January 1, 1933, except through a period of intensive business development that would necessarily have extended several years beyond the date of completion. During this period of business development the fixed charges, return, depreciation, and taxes would have accrued upon the total cost of the completed plant irrespective of the volume of business done. It is also true that during this time a substantial proportion of the completed plant would have been idle compared to the amount of business done by the identical plant, the property of Lone Star Gas Company as of January 1, 1933. This percentage of the plant idle would have been at its maximum at the time the completed plant passed from construction to operation, and would have diminished to zero at the end of the development period. The aggregate cost developed by the application of the fixed charges to the percentage of the completed plant idle, from the time that its constituent elements passed from construction to operation to the date at which the business of the plant in reproduction would have equalled the business of Lone Star Gas Company as of January 1, 1933, is a fair measure of the cost of reproducing the business of Lone Star Gas Company at the date of this appraisal. This method has been applied in the subsequent calculation.

In fixing the ratio of idle plant during the development period to the plant in use as of January 1, 1933, the rate of acquisition of the existing domestic sales only has been used in the subsequent calculations. The estimated net revenue that would be derived from the concurrent sales of industrial gas has been used in the subsequent calculations. [fol. 8543] The estimated net revenues that would be derived from the concurrent sales of industrial gas has been applied as a credit to the cost thus developed.

Method of Calculation:

The following estimate of the cost of reproducing the business of Lone Star Gas Company as of January 1, 1933, has been based upon the application of the fixed charges previously defined, to the sum of money represented by the cumulative percentage of the total cost of the property that would be idle in comparison with the domestic meter saturation and per meter domestic sales of the company as of

January 1, 1932*, during the period of time in which it would be necessary to secure this domestic business. From the total thus obtained there has been deducted the estimated net revenues from the sale of industrial gas that would have accrued during this development period.

Certain assumptions have been made that serve as the basis for the subsequent calculations. These assumptions conform to conditions that would normally be met in reproducing the business of Lone Star Gas Company and have been based upon a careful analysis of historic data.

A detailed study has been made of the existing system and of the component parts of the system that would be constructed in each of the three years of the construction period. The hypothetical construction program that resulted from [fol. 8544] this detailed study, and which has been used as the basis for the calculation of Interest During Construction and other general costs that would be affected by the character and quantity of expenditures in each construction year was developed primarily upon the assumption that the larger and more important markets of the company would be attached at the end of the first construction year and that the smaller outlying markets would be reached at the end of the last construction year.

This assumption conforms to the historical development of the property and results in minimum charges for the cost of business development.

For practicability of calculation, it has been estimated that at the end of the first construction year a certain percentage of the completed plant would pass from construction to operation. The proportionate part of the completed plant affected by this transition has been fixed by the ratio of the cost of the physical property installed during the first construction year to the total cost of the physical property. The same method has been applied to the plant completed in each of the two succeeding construction years.

---

*NOTE.—All calculations of the rate of domestic business saturation are based upon the domestic meter and use saturation of Lone Star Gas Company as of January 1, 1932. The meter and use saturation as of that date were practically unchanged as of January 1, 1933. The same period was also used for the determination of the credit to be applied for net revenue from industrial sales.

A determination has been made of the cities and towns now served by Lone Star Gas Company that would be attached to the system by reason of each successive year's construction.

It has been assumed that the group of cities and towns served by the section of the system completed during the first construction year would begin domestic service at the beginning of the second construction year, that the cities and towns served by the section of the system completed [fol. 8545] during the second construction year would begin domestic service at the beginning of the third construction year, and that the cities and towns served by the section of the system completed during the third construction year would begin domestic service at the beginning of the first year following the completion of construction.

The result of the application of this method is shown as follows:

First Construction Year:

No domestic business development.

Second Construction Year:

First domestic development year for first group of cities and towns attached.

Third Construction Year:

Second domestic development year for first group of cities and towns attached.

First domestic development year for second group of cities and towns attached.

First Year Following Completion:

Third domestic development year for first group of cities and towns attached.

Second domestic development year for second group of cities and towns attached,

First domestic development year for third group of cities and towns attached.

This method has been applied to each succeeding year until the development of the domestic business of Lone Star Gas Company as of January 1, 1932 would be complete.

In order that the calculations might be made, it was necessary to make the following determinations:

1. The rate at which the individual cities and towns served by Lone Star Gas Company would acquire the domestic

meter saturation and domestic customer use as of January 1, 1932.

[fol. 8546] 2. The percentage of the total domestic business of Lone Star Gas Company represented by the domestic business of each group of cities and towns initiating domestic sales at the beginning of the second construction year, the third construction year, and the first year following completion.

3. The proper annual rates to be applied for interest, depreciation and taxes upon the cumulative percentage of the reproduction cost of the property of Lone Star Gas Company as of January 1, 1932, found to be idle during the period of business development.

4. The percentage of the total reproduction cost of Lone Star Gas Company completed during each of the construction years.

5. The rate at which the net revenue from the sale of industrial gas, earned by Lone Star Gas Company, year ended January 1, 1932, would be acquired during the development period.

Analysis of the Rate at Which the Individual Cities and Towns Would Acquire the Domestic Meter Saturation and Domestic Customer Use as of January 1, 1932:

(Explanatory Note.) Lone Star Gas Company sells no gas direct to domestic consumers except in the case of the domestic sales of the Fort Worth Division. If the Fort Worth Division is grouped with the other cities and towns served, the rate at which Lone Star Gas Company would acquire its saturation of domestic business would be directly proportional to the rate at which saturation of domestic business would be acquired by the cities and towns receiving their supply of domestic gas from its system.

The cities and towns served by the pipe line system of Lone Star Gas Company logically fall into three groups when classified with reference to domestic natural gas service. Each of these groups have distinct characteristics and would acquire domestic meter and customer use satura-

tion over different intervals of time. These groups are as follows:

Group A—Metropolitan Districts:

The Dallas and County Gas Companies that serve the Dallas Metropolitan area and the Fort Worth Division of Lone Star Gas Company are the only distribution agencies served [fol. 8548] by the system that fall into this classification. These metropolitan districts would be served by artificial gas prior to the introduction of natural gas. Despite this fact, however, domestic saturation would require a longer development period than would be required in the case of the second and third groups.

Group B—Intermediate cities that would be served by artificial gas prior to the introduction of natural gas.

Waco, Wichita Falls and Abilene are cities served by Lone Star Gas Company that are typical of the cities that have been classified in this group. These cities would acquire their domestic saturation at a more rapid rate than the Metropolitan Districts, but at a slower rate than the towns classified under Group C.

Group C—Small cities and towns that would not be served by artificial gas prior to the introduction of natural gas.

The majority of the towns served by the distribution plants of the Community National Gas Company are typical of this group. Despite the fact that no artificial gas service would exist prior to the introduction of natural gas, domestic saturation would be acquired more rapidly than in the case of Group A and B.

Analysis—Group A:

The historical development of domestic meter saturation and domestic customer use of the combined business of the Dallas Gas Company and County Gas Company from the date of the introduction of natural gas to the date of meter and use saturation has been used as the basis for the calculation for Group A.

[fol. 8551] This statistical data is shown in graphic form in Curves Showing Historic Development Domestic Business—Dallas Gas Company 1908-1930.

An inspection of this graph discloses the fact that the development of domestic meter and use saturation was rapid and uniform from 1910 to 1915, and that saturation was static from 1915 to 1920, and that from 1920 to the date of 100% saturation there was a resumption of the rate of increase of meter and use saturation. The static condition following 1915 was due to several abnormal circumstances. In the case of domestic meters, there was a rapid increase in population and a restriction in utility extensions and home construction due to war time restrictions. This combination of circumstances resulted in an actual decline in the percentage of meter saturation. In the case of domestic use the similarity in the behavior of the curves was due to acute gas shortage during the period culminating in 1919 and 1920.

For these reasons the curves for meter and use saturation have been projected, as shown, for the purpose of eliminating the effect of the abnormalities noted.

With these normal curves of historical development as a basis, a graph was prepared translating these normal historic developments that had extended over a period of twenty years into a hypothetical development period of six years. This graph is shown as Curves Showing Estimated Percentage of Idle Plant—Dallas and Fort Worth (Group A) Domestic Basis.

From this graph there has been developed the estimated percentages of idle plant, domestic basis, by development years for Group A.

Defendant's Exhibit No. 28—Continued

[fol. 8553]

Development Year	Average Percent of Plant Idle	Average Percent of Plant Active
1	78.0	22.0
2	55.5	44.5
3	36.0	64.0
4	22.5	77.5
1	12.5	87.5
6	4.0	96.0

Analysis—Group B:

The estimated development for cities in Group B was also taken from Curves Showing Historic Development—Dallas Gas Company, 1908-1930.

In the case of Group B the development period was reduced to five years. This development period conforms to the history of domestic meter and use saturation in cities of this class. From this graph there has been developed the percentages of idle plant, domestic basis, by development years for Group B:

Development Year	Average Percent of Plant Idle	Average Percent of Plant Active
1	78.00	22.00
2	48.25	51.75
3	29.00	71.00
4	15.50	84.50
5	5.00	95.00

Analysis of Group C:

The actual history of business development was available for typical towns classified under Group C. Seven towns in the State of Oklahoma having gas service for more than four years were analyzed. These towns range from the smaller towns (Achille) to the larger towns (Durant) in Group C and form a representative basis for the normal behavior of Group C in the matter of the development of domestic business.

The following tabulations set out the results of this analysis:

Totals	3,352	91.3	305,999.9

Weighted per cent of consumption 100.

This statistical data is shown in graphic form in Curves Showing Historic Development Seven Oklahoma Towns. From this graph there has been developed the percentages of idle plant, domestic basis, by development years for Group C.

Development Year	Average Percent of Plant Idle	Average Percent of Plant Active
1	65.4	34.6
2	24.9	75.1
3	6.1	93.9
4	0.0	100.0

In connection with the foregoing estimates of the percentages of idle plant during the domestic business development period for the three groups of cities and towns served by Lone Star Gas Company, the following general comment is offered.

The historical development of the domestic business of Dallas and County Gas Companies that was used as the basis for the calculations for both Group A and Group B was initiated with rates for domestic service substantially below rates now in effect and substantially lower than any rates that could be made at the initiation of service in the reproduction of Lone Star Gas Company. For this reason [fols. 8557-8563] the historical acquisition of domestic business in the Dallas Metropolitan area up to 1920 proceeded more rapidly than could be the case under rate schedules that would necessarily apply in reproduction as of January 1, 1933.

In the historical development of the domestic business of Group C, the time taken for the analysis was during a period of prosperity and easy credit. This also applies to the last ten years of the analysis for Group A and Group B.

Under present economic conditions, the estimated rate of saturation could not be attained in practice, and for this reason the development period would be extended and percentages of idle plant at successive stages of this period substantially increased.

In this estimate of the cost of business development, none of the effects of these factors has been applied to the results of the calculations.

The Percentage of the Total Domestic Business of Lone Star Gas Company Represented by the Group of Cities and Towns Receiving Service at the End of the First Construction Year:

(NOTE.) The following tabulations are from the records of the company, year ended September 30, 1931. The percentages used would not be modified by the use of the records of a later date.

Towns	Amount	Percent of Lone Star Total Domestic Sales.
Group A:		
Dallas		
Dallas Gas Company	$1,585,176.68	
County Gas Company	815,015.41	
Fort Worth Division	1,303,408.72	
Total	$3,703,600.81	51.15

Recapitulation

First Year				
Group A	$3,703,600.81		51.15	
Group B	1,126,296.64		15.56	
Group C	212,026.70		2.94	
		$5,041,924.15		69.65
Second Year				
Group B	$336,509.60		4.65	
Group C	751,698.53		10.38	
		1,088,208.13		15.03
Third Year				
Group C	$1,110,287.40	1,110,287.40	15.32	15.32
Total		$7,240,419.68	.....	100.00

[fol. 8565] From the data derived from the analyses of the rate at which the three groups of cities and towns would acquire their saturation of domestic meters and customer use, and from the determination of the percentage of the total domestic business of Lone Star Gas Company represented by the three groups that would be attached to the system, it is possible to calculate by years the percentage of the total plant that would be idle during the development period.

The following tabulations set out the percentage of the total plant idle, domestic bases, during each of the six development years. It will be noted that for the first development year only the plant constructed in the First Construction Year would be in service, and that for the Second Development Year only the plant constructed in the First and Second Construction Years would be in service. For this reason, the indicated percentages of the total plant idle for each of these development years will be reduced in the final calculations by the application of the percentage of the total plant in service in each of these years to the indicated percentage idle.

First Development Year

Group	Percent of Total Dom. Sales	Percent of Saturation	Percent of Total Plant Active	Percent of Total Plant Idle
Group A (1)...	51.15	22.00	11.25	.....
Group B (1)....	15.56	22.00	3.42	.....
Group C (1)....	2,94	34.60	1.02	.....
			15.69	84.31

(Note) First Year's Construction in service.

[fol. 8566]

Second Development Year

Group	Percent of Total Dom. Sales	Percent of Saturation	Percent of Total Plant Active	Percent of Total Plant Idle
Group A (1)....	51.15	44.50	22.76	.....
Group B (1)....	15.56	51.75	8.05	.....
Group B (2)....	4.65	22.00	1.02	.....
Group C (1)....	2.94	75.10	2.21	.....
Group C (2)....	10.38	34.60	3.59	.....
			37.63	62.37

(Note) First and Second Year's construction in service.

Third Development Year

Group	Percent of Total Dom. Sales	Percent of Saturation	Percent of Total Plant Active	Percent of Total Plant Idle
Group A (1)....	51.15	64.00	32.74	.....
Group B (1)....	15.56	71.00	11.05	.....

			97.72	2.28

(Note) Total plant in service.

Annual Rates for Interest, Depreciation and Taxes to be Applied to the Cumulative Percentage of Reproduction Cost Found To Be Idle During Development Period.

Interest:

While that portion of the property of Lone Star Gas Company that would be in operation during the develop-

ment period would legally be entitled to the application of an annual rate based upon what constituted a fair return for the use of the property, in this estimate an annual rate of 8%, identical with the annual rate used in the calculation of Interest During Construction, has been used.

[fol. 8568] The relation between the loss of interest during construction on that portion of the total cost represented by the plant that would be wholly idle, and the loss of return on that portion of the total cost represented by the plant that is operative but unsaturated during the development period is a very close one. In this estimate a distinction has been made between them insofar as the annual rate, expressed as a percentage and applied to cost of idle plant, is concerned. Eight percent has been applied to the percent of total plant idle during the first and second development years. For the four succeeding development years ten percent has been applied.

Depreciation:

The weighted annual rate of reserve for depreciation and amortization for the property of Lone Star Gas Company subject to depreciation and amortization, expressed as a percent per annum, has been determined to be approximately 6.00 percent.

The following tabulation sets out the items of property and the individual annual rates from which this weighted rate was obtained:

Item	Annual Rate of Reserve
Gas well construction and equipment	13.60%
Drilling and cleaning equipment	
Well lines	14.34%
Main transmission lines	5.66%
Field compressor stations and structures	6.23%
Main line compressor stations and structures	5.20%
General office structure	3.00%
General office equipment	10.50%
General shop equipment	10.00%
General garage equipment	
Telephone system	5.65%
Construction tools and equipment	25.00%

These rates, which are exclusive of the charges for cancelled and surrendered leases, dry hole expense, and deple-

tion, were determined for Lone Star Gas Company as a going concern with saturation complete.

[fol. 8569] In the reproduction of the property, these annual rates would be subject to certain modifications, Depreciation on the General Office Structure has been included as a part of Other General Costs during the Pre-Construction and Construction Periods. Depreciation on Office Furniture and Fixtures has been charged to the costs of the various departmental sections.

The annual rates set out for well lines, main gathering lines, gas well construction and equipment, and field compressor stations are in part a function of the rate of use of gas, and for this reason would be less during a period of business acquisition than during the periods when saturation was complete.

In view of these facts, together with the fact that the property would be new, the annual rate has been modified to conform to the conditions that would be met in reproduction and the following schedule has been adopted:

Period	Annual Rate of Reserve
First Development Year	3.0%
Second Development Year	3.5%
Complete Plant—Third Development Year	4.0%
Complete Plant—Fourth Development Year	4.5%
Complete Plant—Fifth Development Year	5.0%
Complete Plant—Sixth Development Year	5.5%

Taxes:

As developed under Taxes During Construction, the annual tax factor applicable to the public service property of Lone Star Gas Company for the year ended December 31, 1931, was $301,820 after giving effect to the fact that taxes on General Office Land, General Office Structure, Other General Land (Parking Lot) and Furniture and Fixtures had been included as a part of Other General Costs.

[fol. 8570] The Percentage of the Reproduction Cost of Lone Star Gas Company as of January 1, 1933, Completed During Each Construction Year:

From the calculations in Expenditures by Periods, it was determined that the percentage of total expenditures, $64,-

488,917, passing into service during each construction year, would be as follows:

Construction Period—First Year	43.30%
Construction Period—Second Year	36.66%
Construction Period—Third Year	20.04%

Calculations of Fixed Charges on Idle Plant

(1.) Interest and Return

First Development Year		
Total Plant in Service	43.30%	
Total Plant Active	15.68%	
Per Cent of Total Plant Idle	27.62%	
27.62% of $64,488,917 = $17,811,839		
$17,811,839 at 8% for one Year		$1,424,947
Second Development Year		
Total Plant in Service	79.96%	
Total Plant Active	37.63%	
Per Cent of Total Plant Idle	42.33%	
42.33% of $64,488,917 = $27,298,159		
$27,298,159 at 8% for one Year		$2,183,853
Third Development Year		
Total Plant in Service	100.00%	
Total Plant Active	62.06%	
Per Cent of Total Plant Idle	37.94%	
37.94% of $64,488,917 = $24,467,095		
$24,467,095 at 10% for one Year		$2,446,710

[fol. 8571]

Fourth Development Year		
Total Plant in Service	100.00%	
Total Plant Active	80.29%	
Per Cent of Total Plant Idle	19.71%	
19.71% of $64,488,917 = $12,710,766		
$12,710,766 at 10% for one Year		$1,271,077
Fifth Development Year		
Total Plant in Service	100.00%	
Total Plant Active	91.18%	
Per Cent of Total Plant Idle	8.82%	
8.82% of $64,488,917 = $5,687,922		
$5,687,922 at 10% for one Year		$568,792

Defendant's Exhibit No. 28—Continued

Sixth Development Year		
Total Plant in Service	100.00%	
Total Plant Active	97.72%	
Per Cent of Total Plant Idle	2.28%	
2.28% of $64,488,917 = $1,470,347		
$1,470,347 at 10% for one Year		$147,035
Recapitulation of Loss of Return on Idle Plant		
First Development Year		$1,424,947
Second Development Year		2,183,853
Third Development Year		2,446,710
Fourth Development Year		1,271,077
Fifth Development Year		568,792
Sixth Development Year		147,035
Total		$8,042,414

(2.) Depreciation:

Of the total reproduction cost $64,488,917, $4,474,272 representing Preliminary Development and Organization Costs was determined to be non-depreciable, therefore, the total reproduction cost upon which depreciation on idle plant has [fol. 8572] been calculated is fixed at $60,014,645.

From the preceding analysis, certain percentages of the plant were found to be idle during each of these development years. In the following tabulation, these percentages are applied to the total reproduction cost subject to depreciation.

First Development Year	$60,014,645 x 26.10%	$15,663,822
Second Development Year	$60,014,645 x 40.88%	24,533,987
Third Development Year	$60,014,645 x 37.94%	22,769,556
Fourth Development Year	$60,014,645 x 19.71%	11,828,887
Fifth Development Year	$60,014,645 x 8.82%	5,293,292
Sixth Development Year	$60,014,645 x 2.28%	1,368,334

The above figures are the estimated reproduction cost of the property as a whole (without consideration for certain minor items of property not subject to depreciation) subject to depreciation that would be idle during each of the development years.

Defendant's Exhibit No. 28—Continued

First Development Year	
Reproduction Cost Plant Idle	$15,663,822
Times Depreciation Rate	3.0%
Depreciation on Idle Plant	$469,915

Total		$435,044

[fol. 8575] Credits to Fixed Charges on Idle Plant by Reason of Net Revenues From the Sale of Industrial Gas:

As set out in the preliminary discussion of Going Value and the Cost of Business Development as a measure of Going Value, all calculations with reference to the percentage of plant that would be idle after having passed into service were based upon the estimated rate of acquisition of the domestic business of Lone Star Gas Company as of January 1, 1933. In view of this basic assumption it is obvious that such net revenues as would be derived from the sale of industrial gas during the periods in which the cost of business development was established by the application of return, taxes and depreciation to the reproduction cost of the plant idle, would be a credit to the overall costs thus developed. It is necessary, therefore, to make a determination of the rate of acquisition of industrial gas sales, and to estimate the net revenue from such sales concurrent with the acquisition of domestic business in order to arrive at a proper estimate of the true cost of business development.

Following the methods of estimate adopted with reference to the acquisition of domestic business, a careful analysis was made of the probable development of the industrial business of Lone Star Gas Company as of January 1, 1932, and the probable net revenues that would be secured from

this class of sales. No material change has taken place in the industrial sales of Lone Star Gas Company since the date of this analysis, and the estimated credits based on net revenue from industrial sales would not be affected by the results of a similar study made as of January 1, 1933.

Organization Plan of Industrial Sales Section:

[fol. 8576] In the general organization plan as indicated by the organization chart, the Industrial Sales Section was made a part of the group whose expenses would be attributable to the cost of reproduction. No estimate of cost, however, was included in Undistributed General Costs for the reason that the expenses of the Section during the period of business development would more logically become a deduction from the gross revenues from industrial sales, and these expenses have been so treated in the estimate.

The Industrial Gas Section would be organized immediately upon the completion of corporate organization by the employment of the industrial engineer who would in turn engage the personnel of the Section, and proceed with the detail work hereinafter outlined.

This step would be necessary by reason of the fact that the surveys, reports, and other market data secured by the originating group would not contain the detailed technical information that would be required for negotiations with owners of industrial plants using other forms of fuel. A complete detailed study of the characteristics and requirements of each industrial plant proposed to be served, would be made before negotiations for conversion could be definitely begun.

In order to properly contact the prospective industrial consumers (the industrial consumers of Lone Star Gas Company as of January 1, 1932, the industrial customers temporarily inactive at this date, and the prospective customers who would be unsuccessfully solicited) the following organization would be required:

Pre-Construction Period and First Construction Year:

Chief Industrial Engineer.
Assistant Industrial Engineer.
Ten Industrial Sales Engineers.
Draftsman.
Stenographer.

[fol. 8577] Second Construction Year:

Chief Industrial Engineer.
Chief Industrial Engineer.
Assistant Industrial Engineer.
Office Engineer.
Twenty Industrial Sales Engineers.
Draftsman.
Stenographer.

Third Construction Year:

Chief Industrial Engineer.
Assistant Industrial Engineer.
Office Engineer.
Thirty Industrial Sales Engineers.
Two Draftsmen.
Two Stenographers.

First Year Plant Wholly Operative:

Chief Industrial Engineer.
Assistant Industrial Engineer.
Office Engineer.
Twenty Five Industrial Sales Engineers.
Draftsman.
Two Stenographers.

Second Year Plant Wholly Operative:

Chief Industrial Engineer.
Assistant Industrial Engineer.
Office Engineer.
Fifteen Industrial Sales Engineers.
Draftsman.
Two Stenographers.

The chief industrial engineer would be responsible for the work of the Section, and the direction of its personnel. He would necessarily be a man thoroughly trained in combustion engineering, familiar with the design and installation of gas burning equipment, and in addition to his technical qualifications, he would possess qualities of salesmanship. The sales engineers would be required to make detailed surveys of industrial plants, select or design the proper gas burning equipment for individual plants, install the equipment, and supervise the initial tests until proper utilization would be secured.

[fol. 8578] Each of the men engaged in the work would be required to have practical experience as well as technical training, and for this reason they could only be secured from the personnel of operating natural gas companies, or from the manufacturers of gas burning equipment. The following schedule of salaries give effect to this fact as well as to the fact that as the company passed into operation and gave permanent employment to the individual employees of the Section there would be a normal reduction in salaries.

	Rate Per Month	Rate Per Annum
Schedule of Salaries—Development Period		
Chief Industrial Engineer	$500	$6,000
Assistant Industrial Engineer	300	3,600
Office Engineer	250	3,000
Senior Sales Engineers	250	3,000
Junior Sales Engineers	200	2,400
Draftsmen	150	1,800
Stenographers	110	1,320
Schedule of Salaries—Operating Period		
Chief Industrial Engineer	450	5,400
Assistant Industrial Engineer	250	3,000
Office Engineer	175	2,100
Senior Sales Engineers	225	2,700
Junior Sales Engineers	200	2,400
Draftsman	150	1,800
Stenographer	110	1,320

Estimate of the Rate of Acquisition of Industrial Sales

In order to estimate the rate of acquisition of the industrial sales of Lone Star Gas Company as of January 1, 1933, it is first necessary to determine the percentage of the sales for the year ended December 31, 1931, that would be made available to the company's system (in reproduction) by the progress of the construction program that has been adopted.

The following tabulations taken from the records of Lone Star Gas Company and the records of the distributing companies served by it, set out the volume of industrial sales, the money received from these sales in each of the cities and towns in which industrial sales were made, and the construction year in which these cities and towns would be attached to the system.

First Construction Year:

Towns	M. Cubic Ft.	Amount
Dallas		
Dallas Gas Company	2,808,295	$447,544.72
County Gas Company	76,879	12,360.64
Fort Worth Division	3,136,173	515,848.67
Abilene (North Park)	18,673	2,707.64
Abilene	549,974	89,559.69
Cleburne	116,472	19,574.65
Denison	72,241	14,306.59
Sherman	215,545	36,794.62
Waco	483,224	83,736.32
Wichita Falls	88,579	19,640.26
Albany	6,659	1,214.08
Baird	21,316	3,481.81
Clyde	.....	.....
Eastland	9,643	2,104.12
Moran	217	31.47
Putnam	3,128	453.57

Texas Right-of-way Sales	3,043,725	355,369.78
Oklahoma Right-of-way Sales	14,866	2,070.54
Total	4,855,275	$641,255.88
Grand Total	14,116,540	$2,184,540.22

Per cent of Total Industrial Sales First Construction Year	54.69
Per cent of Total Industrial Revenue First Construction Year	58.18
Per cent of Total Industrial Sales Second Construction Year	10.91
Per cent of Total Industrial Revenue Second Construction Year	12.47
Per cent of Total Industrial Sales Third Construction Year	34.40
Per cent of Total Industrial Revenue Third Construction Year	29.35

In connection with the foregoing tabulations from which the percentages of industrial sales of Lone Star Gas Company for the year ended December 31, 1931, have been determined with reference to the construction years in which the individual cities and towns would be attached to the system, it has been estimated that industrial gas service would be initiated at the end of the first six month's construction. This assumption would result in an average of three months service during the first construction year to the cities and [fol. 8593] towns attached during the First Construction Year, an average of six months service during the Second Construction Year to the cities and towns attached during the Second Construction Year, and an average of six months

service during the Third Construction Year for cities and towns attached during the Third Construction Year. For each year following the initiation of service, it is assumed that the business acquired by each group during each year would be attached uniformly throughout the year.

The following tabulation sets out the relation of the total industrial revenue of Lone Star Gas Company as of December 31, 1931, as developed for the cities and towns attached during the construction period, to the time that service would be available to each group during the construction and post-construction periods. For convenience, the cities and towns reached during the first, second, and third construction years will be called Group I, Group II, and Group III, respectively.

Cities and Towns	Group I	Group II	Group III
Percent of Total Industrial Revenue	58.18	12.47	29.35
First Construction Year	3 Months Av.		
Second Construction Year	One Year	6 months Av.	
Third Construction Year	One Year	One Year	6 Months Av.
First Operative Year	One Year	One Year	One Year
Second Operative Year	One Year	One Year	One Year
Third Operative Year	One Year	One Year	One Year
Fourth Operative Year	One Year	One Year	One Year

Rate of Acquisition of Industrial Sales by Groups:

The estimate of the rate of acquisition of industrial sales by groups of cities and towns attached during each of the construction years is based upon the actual experience of Lone Star Gas Company during the period between 1920 and 1927. During the year 1921, the industrial sales of the company were 2,600,000 M. cubic feet. In 1927 the sales had [fol. 8594] reached 24,200,000 M. cubic feet. The historical rate of acquisition during this period has been modified by increasing the rate of acquisition during the first, second and third development years, and the results applied to Groups I and II for the reason that practically all cities and towns in Groups I and II were a part of the system from 1921 to 1927. The industrial sales in Group III would be acquired at a more rapid rate, and the estimated rate of acquisition has been adjusted to conform to this condition.

The following tabulation sets out the estimated annual rates of indusrial sales acquisition for cities and towns in Groups I, II, and III.

Defendant's Exhibit No. 28—Continued

Year	Group I. % of Total	Group II. % of Total	Group III. % of Total
First Construction Year	20.6	....	....
Second Construction Year	23.4	20.6	....
Third Construction Year	23.4	23.4	40.0
First Year Wholly Operative	21.0	23.4	25.0
Second Year Wholly Operative	7.9	21.0	20.0
Third Year Wholly Operative	3.7	7.9	10.0
Fourth Year Wholly Operative	....	3.7	5.0

The foregoing percentages of annual acquisition represent the estimated percentage of the industrial sales acquired at the end of each period. The average percentages acquired for each period are shown in the following tabulation:

Year	Group I. % of Total	Group II. % of Total	Group III. % of Total
First Construction Year	5.2	....	....
Second Construction Year	32.3	10.3	....
Third Construction Year	55.7	32.3	20.0
First Year Wholly Operative	77.9	55.7	52.5
Second Year Wholly Operative	92.3	77.9	75.0
Third Year Wholly Operative	98.2	92.3	90.0
Fourth Year Wholly Operative	100.0	98.2	97.5

These percentages were obtained by adding one-half of the percentages acquired in each year to the cumulative percent-[fol. 8595] ages of the preceding years. This method conforms to the assumption that the business acquired in any given year would be secured uniformly during the year.

Cost of Gas:

In order to determine the net revenue from the sale of industrial gas, it is necessary to fix the cost of gas. The cost of gas together with the cost of securing the business are proper deductions from the gross revenues received by Lone Star Gas Company from the sale of industrial gas in order to fix the net revenues from such sales.

For the year ended December 31, 1931, Lone Star Gas Company paid $1,456,830.39 for 23,017,174 M. cubic feet (as measured), or an average price of 6.33 cents per M. cubic feet. It is impossible to determine with any degree of accuracy the cost of gas produced by the company. Furthermore, the amount of gas purchased by the company during the year 1931 represented 72.25 per cent of the total gas purchased and produced. For these reasons, together with the fact that there would be no material difference between the actual cost of gas produced and the cost of gas purchased,

the average cost of gas purchased is used as the basis or the estimate.

Cost of Compression:

During the year 1931, Lone Star Gas Company compressed 73.8 per cent of the total gas delivered at an average cost of 1.74 cents per M. cubic feet compressed (operation only).

It is probable that the percentage of compression for gas sold for industrial use would be some what less than the percentage of compression for all gas delivered. For this reason, it is estimated that 50 per cent of the gas sold for [fol. 8596] industrial use would be compressed. This assumption results in a cost of .87 cents per M. cubic feet for the cost of compression for gas sold for industrial use.

Estimate of Net Revenue from Industrial Sales by Years

Group I		
Gross Industrial Revenues Group I.—1931		$1,270,963
Less: 7,720,923 M. cubic feet at 7.2 cents per M		555,906

[fol. 8600] Personnel Costs

In the estimate of Undistributed General Costs no specific allowance has been included for the costs that would be incurred in the reproduction of the property and business of Lone Star Gas Company in connection with collecting, employing and coordinating into working unit the personnel that would be required for the various departmental organizations.

In summarizing the factors that contribute to the Going Value of Lone Star Gas Company as of January 1, 1933, the sixth factor enumerated set out the fact that the company, over a period of more than twenty years operating experience, had developed a highly trained and efficient operating personnel consisting of executives, counsel, technicians, department heads and other employees, each of whom was familiar with all phases of the natural gas business in general, and with all phases of the business and property of Lone Star Gas Company in particular.

It was further noted that this trained organization had peculiar value due to the fact that the natural gas business

is not a universal public service enterprise but is confined by natural reasons, to limited geographic areas and that trained and experienced natural gas executives, operators and technicians are correspondingly difficult to secure and to weld into a functioning organization.

This general statement could be made specific by an analysis of the experience and qualifications of the various members of the Lone Star Gas Company organization. A number of the departmental heads are outstanding in their respective lines of work. In practically every case respon- [fol. 8601] sible department heads, together with their immediate subordinates, have been associated with the organization of the company for a number of years. To the value of their inherent technical qualifications, there has been added the value that has been brought about by an intimate familiarity with the operating and physical details of the property itself.

The existence of this coordinated personnel and its definite association with this particular property constitutes an element of value that would be recognized and paid for by any willing buyer of the property as of January 1, 1933. The existence of this element of value is not difficult to determine, but the worth of it measured in terms of dollars cannot be fixed by any mathematical formula. The reasonableness of the current operating charges of the company and the reasonableness of the unit costs of reproduction which have been used as the basis of the determination of the reproduction cost of the physical elements of the property are examples of the effect of the value of the operating personnel upon any current investigation regarding the rates and charges of the company.

Aside from the consideration that should be given to the element of value that inheres in the property of Lone Star Gas Company by reason of its trained personnel and its established operating routines, in the reproduction of this property certain out-of-pocket expenditures would be incurred in the physical assembly and selection of the various individuals set out as part of the various department groups detailed in the preceding volume of this report. This element of "Cost" would necessarily be incurred in reproduction without reference to the "Value" of the organization to the company after its construction program had been completed. [fol. 8602] In addition to the costs of assembly and selection

there would also be additional and inescapable costs in connection with personnel turn-over during the normal construction period and the early development years. This cost would be incurred in connection with:

1. The expense of interviews with prospective executives and department heads.

2. The excess salaries required to secure trained men from the personnel of other natural gas companies.

3. The expense of moving household furniture of executives and department heads.

4. The lack of efficiency on the part of subordinate employees during the earlier part of the construction period.

As previously noted in another section of this report, the unit costs of construction used in the estimate of the reproduction cost of the physical property were based upon the assumption that the company would construct the property without the intermediary services of a general engineering contractor. The method of estimate adopted eliminated the item of contractor's profit and correspondingly increased the personnel and the responsibilities of the administrative and supervisory group included in the estimate of Undistributed General Costs.

In the estimate of Undistributed General Costs the salaries adopted conform very closely to the salaries paid in normal times to the various individuals whose functions in the organization are set out in detail in the estimate. In no case do the salaries adopted reflect the salaries that would be required to secure the services of the various individuals from the organizations of going concerns.

[fols. 8603-8604] In the development of the various departmental groups the personnel set out has been based upon the assumption that each individual was qualified for his specific work and was trained in the routines required for the efficient discharge of his duties. In actual practice no such ideal conditions could be realized and this failure to conform to the stipulations of this estimate would result in an increased operating personnel and in increased costs.

It is estimated that the minimum cost of the factors heretofore discussed would be not less than $200,000 in the reproduction of the physical property of Lone Star Gas Company.

Defendant's Exhibit No. 28—Continued

[fol. 8605] Working Capital

General Summary

Materials and Supplies	$555,000
Cash Working Capital	555,000
Advances on Gas Purchase Contracts	436,000
Pre-Paid Insurance and Rentals	40,000
Incomplete Construction	100,000
Gas in System	15,600
Total	$1,701,600

[fol. 8606] Working Capital

Definition:

Cash Working Capital, as used in this reproduction cost of the property and business of Lone Star Gas Company as of December 31, 1932, is intended to include the necessary investment in materials and supplies, advances on gas purchase contracts, pre-paid items of expense, monies invested in materials of construction, and labor for property in construction and not included in the investment accounts in this appraisal; the necessary cash required to operate the company and the normal cash balances required for proper accommodation from commercial banks. Cash Working Capital as distinguished from the structural and general costs, included in this appraisal, is a requirement and a necessary investment of a property in operation. For this reason, the items included in this estimate are based upon the current operating experience of Lone Star Gas Company.

Materials and Supplies $555,000:

Lone Star Gas Company's investment in materials and supplies used in the operation of its public service property, was as of December 31, 1932, approximately $545,000. In addition to this sum, the company had distributed over its system $10,000 worth of pipe for emergency replacements and repairs. This pipe has been inventoried and priced, and the above figure determined.

Cash Working Capital $555,000:

The average operating expenses of Lone Star Gas Company for the year 1932, were $170,000 per month exclusive

of the cost of gas purchased. The least cash upon which the company could operate would be the operating requirements for a forty five day period, or $255,000. No company could [fols. 8607-8608] operate without the maintenance of normal cash balances. Commercial banks extending accommodations require that such balances be maintained no less than sound business management. Lone Star Gas Company maintained such balances, and $300,000 is estimated as the minimum allowance for this purpose.

Advances on Gas Purchase Contracts $436,000:

In the normal conduct of its business, Lone Star Gas Company at all times has substantial amounts tied up in cash and the cost of materials advanced to the producers of gas. The sum represented by these cash advances and the cost of materials as of December 31, 1932, was $436,000.

Pre-Paid Insurance and Rentals $40,000:

The sum of $40,000 represents the actual outlay on the part of Lone Star Gas Company for pre-paid insurance and rentals as of December 31, 1932. This is a normal amount for this type of expense.

Incomplete Construction $100,000:

As of December 31, 1932, the net amount of incomplete construction not included in the investment accounts of this appraisal was approximately $100,000. This figure has been arrived at after giving proper consideration to the amounts involved in non-public service property, expenditures made in behalf of other companies and other proper deductions:

Gas in the System $15,600:

The cubical contents of the pipe line system of Lone Star Gas Company is 156,425 cubic feet, based upon an average working pressure of 200 pounds per square inch. The average cost of this gas after field expenses and compression costs have been added to the base cost of the gas is not less than ten cents per cubic foot.

[fols. 8640-8651] Lone Star Gas Company

Natural Gas Reserves as of January 1, 1933

General Summary

	Lone Star Gas Company's Share M Cubic Feet (2# Base)	
Texas:		
1. *Panhandle District*	222,485,303	
2. Petrolia Field	1,975,851	
3. Leeray District	130,073,023	
4. Sipe Springs District	20,241,912	
5. Cheaney District	1,848,329	
6. Miscellaneous Wells	5,566,672	
Texas Total		382,191,090
Oklahoma:		
1. Chickasha District	2,277,356	
2. Duncan District	485,671	
3. Loco District	282,783	
4. Miscellaneous Wells	1,460,032	
Oklahoma Total		4,505,842
Grand Total		386,696,932

* * * * * * *

[fol. 8652]

	Depth Feet	Temperatures (Degrees F.)
Gray County, Texas	2,785	84.05
Young County, Texas	4,000	135.83
Young County, Texas	4,334	143.37

In calculating natural gas reserves it is not necessary to apply a correction for temperature to the reservoir pressure when the "Pressure-Volume Decline Method" is used, but a temperature correction should be applied to the pressure when the "Porosity-Area Method" is used. In the

former case the reserve is calculated on the basis of a known quantity of gas produced per pound pressure drop, and since the reservoir temperature remains constant, the quantity of gas per pound pressure drop remains the same. In the latter case, however, the reserve is calculated on the basis of the cubical content of the reservoir and a pressure base multiplication factor. This factor should take into consideration the effect on the reservoir pressure of the difference in the existing temperature and the base temperature.

Scope of Report

The Lone Star Gas Company's share of the natural gas reserves has been calculated only in those districts where production exists or where the leases are located in admittedly proven territory.

The summary of these reserves serves as a basis for valuation of those leases which are located in either of the [fols. 8653-8661] above classifications. There are, however, some leases of this company which are located in proven but undeveloped territory, and other located in likely, but as yet unproven, territory for which no reserves have been calculated. These leases are included in Table No. 1, which shows with respect to these leases, the "Lone Star Acre Interest for which no Reserve has been Calculated". In order then to evaluate the Lone Star Gas Company's leaseholds as of January 1, 1933, it is necessary to place a value on the acreage for which no reserve has been calculated in addition to the value of the calculated reserves.

[fol. 8662] Petrolia Field

Clay County, Texas

Summary of Reserves

	Reserves M Cubic Feet (2# Base)
Petrolia Field Proper	1,446,930
Miller Farm	528,921
Total Lone Star Gas Company's Marketable Reserves in the Petrolia District	1,975,851

[fol. 8663] Petrolia Gas Field, Clay County, Texas

Introduction

* * * * * * *

Structurally, the Petrolia field is a well defined dome, being one of several domes located on what is called the Red River arch, a major structural feature of the Mid-Continent. This dome is very well defined by a closed surface structure that is highly accentuated in the sub-surface.

The most important gas production in Petrolia field has been found at depths of approximately 1300 to 1750 feet in sands belonging to the Cisco beds of Pennsylvanian age. These sands are more or less lenticular and as a consequence the field has been somewhat spotted. Formations [fol. 8664] below the Pennsylvanian have not been tested, except by one well, and it was too low, structurally, to be expected to produce. So far as the Permian and Pennsylvanian formations are concerned, the field is considered drilled up for gas and all reserve gas in these two formations can probably be obtained from present existing wells. All of this reserve gas is either owned or controlled by Lone Star Gas Company.

[fol. 8665] Petrolia District, Clay County, Texas

In order to calculate the reserve of gas to be produced from the Lone Star Gas Company's wells in this district, two calculations have been made; one for all of the wells except those on the Miller Farm, and one for the Miller wells. The first division is designated "Petrolia Field Proper", and the other, "Miller Wells."

This distinction is made in view of the fact that the Miller Farm was, on July 6, 1929, adapted to use for storing and returning gas from the main line to the natural reservoir, and back at later periods, through the field suction lines. Accurate measurement data for this gas, both in and out of storage, are available.

In the calculation of the gas reserve for this field, no significance is attached to the gas storage operations. The reserve for the Miller Farm Wells is calculated from the rates of delivery from these wells prior to the beginning of storage operations. The reserve under this acreage will still be available to be produced at some later date.

Petrolia Field Proper

There are thirty-eight wells delivering gas from this division of the Petrolia District. These wells have been on continuous operation for years, and consequently there are [fols. 8666-8667] no maximum shut-in pressure data available to be used in the calculation of reserves. The most accurate method to be applied in the calculation of the reserve to be produced after January 1, 1933, is to calculate the reserve from the delivery decline curve. Such a curve (Figure 5) has been plotted and shown herewith. A continuation of this curve is made from January 1, 1933, down to the point where the amount of gas produced will likely not justify the continued operation of the wells.

* * * * * * *

[fols. 8668-8669] Petrolia District

Miller Wells

Reserves

As stated earlier in this report, the Miller Farm was adapted to the underground storage of gas on July 6, 1929. At that time the lease was delivering gas at the rate of 343.1 M cubic feet per day, and had an available reserve, which reserve is here calculated by applying the same decline factor as was used for "Petrolia Field Proper". That reserve is still available to be produced, which fact is thoroughly established by the data from storage operations.

It is then apparent that the reserve under the Miller Farm was at least as great on January 1, 1933, as it was on July 6, 1929.

The available decline in daily delivery rate from this lease is determined by assuming that its operations would cease with the rest of the field.

Total of Lone Star Gas Company's Marketable Reserves in the Duncan District	485,671

[fols. 8743-8746] Duncan Gas Area

Stephens County, Oklahoma

Introduction

Due to the fact that the fields, in which the Lone Star Gas Company leases are located, are considered fully developed, at present producing depths, it is not necessary to discuss structural conditions in this report. The fields have already passed their production peaks and are, of course, on the decline.

Defendant's Exhibit No. 30—Continued

[fol. 8747] Loco District

Stephens County, Oklahoma

Summary of Reserves

	Reserves M Cubic Feet (2# Base)
Loco Field Proper	282,783
Total of Lone Star Gas Company's Marketable Reserves in the Loco District	282,783

[fol. 8748] Loco Gas Field

Introduction

The Loco gas field is situated in the southeastern part of Stephens County, Oklahoma. Most of this field lies in Sections 8, 9, 10, 14, 15, and 16, Township 3 South, Range 5 West.

* * * * * * *

[fols. 8749-8750] It may be said that the Loco field is "drilled up" and the possibility of further prospecting for gas is slight.

* * * * * * *

[fols. 8751-8757] Miscellaneous Wells

Oklahoma

Summary of Reserves

	Reserves M Cubic Feet (2# Base)

Total of Lone Star Gas Company's Marketable Reserves from the Oklahoma Miscellaneous Wells	1,460,032

* * * * * * *

[fol. 8758] Additional Wells Necessary to be Drilled to Recover Present Reserves

It is estimated that the following number of wells will complete the development for all leases for which the gas reserves have been determined:

1. Shamrock Field (Wheeler County, Texas)	86
2. Petrolia Field (Clay County, Texas)	
3. Leeray Field (Eastland, Stephens Counties, Texas) 38 Wells Gross—Lone Star Gas Company's Interest	31
4. Sipe Springs Field (Comanche, Eastland Counties, Texas)	18
5. Cheaney Field (Eastland County, Texas)	
6. Miscellaneous Wells, Texas	
7. Chickasha Field (Grady County, Oklahoma)	
8. Duncan Field (Stephens County, Oklahoma)	
9. Loco Field (Stephens County, Oklahoma)	
10. Miscellaneous Wells, Oklahoma	
Total Wells	135

[fol. 8759] The total natural gas reserves of the Lone Star Gas Company pertaining to certain developed and proven acreage has been found to be 386,696,932 M cubic feet. This amount of gas represents the total volume which now is contained in the various gas reservoirs between the present reservoir pressure and an assumed abandonment pressure.

We have shown that 135 additional wells will need to be drilled in order to produce this entire reserve. There will be some loss of gas at the completion of these wells. The total amount of gas which will be lost in this manner undoubtedly will be negligible in comparison to the total volume of gas reserves.

The Lone Star Gas Company's method of handling producing gas wells is such that very little gas is wasted in the operation of the wells. Likewise the total amount of gas lost from operation will also be negligible in comparison to the total volume of gas reserves.

An allowance of five per cent of the total volume of gas reserves has been made which, in our opinion, will amply provide for all gas which may be wasted or lost during the

Defendant's Exhibit No. 30—Continued

remaining period of time required for the withdrawal of the total reserves as determined.

Lone Star Gas Company

Appraisal of Gas Reserves

January 1st, 1933

[fol. 8860] Present Fair Value of Net Gas Reserves

January 1st, 1933

Estimated Gross Withdrawal Value (Schedule #1)		$19,451,614
Cost of Recovery:		
Future Developing Costs (Schedule #2)	$2,658,619	
Recovery Operating Costs (Schedule #3)	1,237,661	
Total	$3,896,280	
Less: Estimated Salvable Value of Gas Well Equipment (Schedule #4)	499,958	
Net Cost of Recovery		3,396,322
Estimated Net Recovery Value of Gas Reserves		$16,055,292
Present Worth Factor		.46319
Present Fair Value of Gas Reserves Including Gas Well Equipment and Construction		$7,436,650
Less:		
Gas Well Equipment and Construction as Shown in Appraisal dated Jan. 1st, 1933	$3,894,317	
Overheads applicable to Gas Well Equipment and Construction and Included in Appraisal dated Jan. 1, 1933	860,644	4,754,961
Present Fair Value of Net Gas Reserves		$2,681,689

Defendant's Exhibit No. 31—Continued

[fol. 8861] Summary of Net Gas Reserves and Gross Value

January 1st, 1933

(Schedule #1)

District	Net Gas Reserves M. Cu. Ft.	Unit Value	Gross Value
Texas			
Panhandle	211,361,038	$.047	$9,933,969
Petrolia	1,877,058	.100	187,706

Total	4,280,549	$.079	$339,333
Grand Total	367,362,084	$.053	$19,451,614

[fol. 8862] Summary of Future Developing Costs

Necessary to Recover Gas Reserves

January 1st, 1933

(Schedule #2)

	Number Wells to be Drilled	Average Cost per Well	Total Cost
Shamrock	86	$15,063	$1,295,418
Leeray	31	30,991	960,721
Sipe Springs	18	22,360	402,480
Total	135		$2,658,619

[fol. 8863] Estimated Costs That Will be Incurred in Recovering Net Gas Reserves

January 1st, 1933

(Schedule #3)

Direct Recovery Costs and Ad Valorem Taxes

Total Gas Wells Now Owned and Operated	262
Additional Wells Necessary to be Drilled to Recover Gas Reserves (As Shown on Schedule #2)	135
Total	397

Defendant's Exhibit No. 31—Continued

Average Number Wells Operated per Annum —One Half, Say		200
Estimated Annual Recovery Cost per Well		$200
Estimated Annual Recovery Cost		$40,000
Estimated Number Years Wells Will be Operated to Recover Gas Reserves		20
Estimated Recovery Cost for Recovery Period		$800,000

Gross Production Tax

Gross Value of Net Gas Reserves as Set Out in Schedule #1	$19,451,614	
Gross Production Tax @ 2¼%		$437,661

Summary

Estimated Recovery Cost	$800,000
Gross Production Tax	437,661
Total	$1,237,661

[fols. 8864-8865] Statement of Salvable Value of Material Recovered from Wells Upon Abandonment

(Schedule #4)

Value of Material in Wells Now Owned and Operated			$1,285,234
Value of Material in Wells to be Drilled to Fully Recover Gas Reserves:			
Shamrock District	86 @	$3,432	295,152
Leeray District	31 @	9,851	305,381
Sipe Springs Dist.	18 @	6,337	114,066
Total	135		$714,599
Total			$1,999,833
Net Salvable Value of Material Recovered—25% of Original Cost			$499,958

Lone Star Gas Company

[fols. 8901-8938] Pipe Prices as of June 11, 1934

Large Lots

The net delivered prices shown in this tabulation are prices applying to the Lone Star Gas System in Oklahoma and Texas, with the exception of Galveston and El Paso, Texas. The carload freight rate in arriving at the delivered prices is 84 cents per hundred-weight.

The prices are for "Large" Lots as approved under the Steel Code and are based on the following:

[fol. 8975] DEFENDANT'S EXHIBIT No. 37

P. McDonald Biddison
Consulting Engineer
Tower Petroleum Building
Dallas, Texas

Lone Star Gas Company

Condition of Property 1-1-1933

Public Service Plant, Property and Business

Summary

Item	Reproduction Cost—New	Per Cent Condition	Present Value
Physical Property Including Undistributed General Costs			
Production System Property	$9,141,858.05	99.66	$9,108,352.94
Gathering System Property	1,785,390.34	89.50	1,597,979.87
Transmission System Property	40,297,559.90	92.61	37,320,692.83
Compressing System Property	5,899,838.50	87.89	5,185,631.16
General System Property	2,929,942.78	88.62	2,596,548.36
Total	$60,054,589.57	92.93	$55,809,205.16
Non Physical Values			
Preliminary and Organization	$4,434,328.00	100.00	$4,434,328.00
Working Capital	1,701,600.00	100.00	1,701,600.00
Going Concern Value	7,792,888.00	100.00	7,792,888.00
Total	$13,928,816.00	100.00	$13,928,816.00
Grand Total	$73,983,405.57	94.26	$69,738,021.16

The above determination of Present Value of Public Service Plant, Property and Business of Lone Star Gas Company as of January 1, 1933, as detailed in subsequent pages is based upon Reproduction Cost-New as determined by an appraisal by E. A. Steinberger, Ed. C. Connor and P. McDonald Biddison as of January 1, 1933 and represents my judgment based upon an examination of the property of the relative Present Value to Cost of Reproduction-New.

Dallas, Texas
Aug. 30, 1933

P. McDonald Biddison,
Consulting Engineer

Appraisal

Cost of Reproduction New

May 1, 1934

Public Service Plant, Property and Business, Exclusive of Fort Worth Division

E. A. Steinberger, P. McDonald Biddison, Ed. C. Connor, Engineers, Dallas, Texas

[fol. 9242] Summary

Physical Property Including Undistributed General Costs:	
Production System Property	$9,101,844.20
Gathering System Property	1,774,208.64
Transmission System Property	41,968,705.49
Compressing System Property	5,875,164.83
General System Property	2,914,048.13
Total	$61,633,971.29
Non Physical Values:	
Preliminary and Organization	$4,434,328.00
Working Capital	1,701,600.00
Going Concern Value	7,792,888.00
Total	$13,928,816.00
Grand Total	$75,562,787.29

This appraisal is based upon an inventory of all property as of January 1, 1933, to which have been applied market prices of materials of construction and prevailing labor rates as of the same date; with the exception of "Transmission Line Equipment", to which item of property have been applied market prices of materials of construction and labor rates prevailing as of May 1, 1934.

P. McDonald Biddison, Consulting Engineer. Ed. C. Connor, Consulting Engineer. E. A. Steinberger, Valuation Engineer.

[fols. 9259-9267] DEFENDANT'S EXHIBIT No. 42

Report Annual Reserve Accruals Required for Lone Star Gas Company

January 1, 1933

[fol. 9268] General Statement

The property of Lone Star Gas Company as of January 1, 1933, subject to depreciation and/or amortization, consisted of the following major items:

1. Gas well construction, equipment and structures.
2. Well line equipment and structures.
3. Field line equipment and structures.
4. Tap line equipment and structures.
5. Transmission line equipment and structures.
6. Measuring station equipment and structures.
7. Telephone line equipment and structures.
8. Compressor station equipment and structures.
9. Automotive equipment.
10. Drill tools.
11. General structures and equipment.
12. Furniture and Fixtures.
13. General tools and implements.

It will be understood in the subsequent discussion that the designation of the above items is intended to include all costs of installation, rights-of-way costs where property is subject to ultimate abandonment, undistributed general costs, engineering and supervision costs, and all other expenditures that would be lost by abandonment or that would be reincurred in replacement.

Scope of the Investigation

In order that a rational application of the basic principles of depreciation accruals might be made to the depreciable property of Lone Star Gas Company as of January

1, 1933, a comprehensive analysis has been made of the history of Lone Star Gas Company with reference to the [fol. 9269] mortalities of its major property units.

This investigation consisted of a complete analysis of all vouchers of the company covering the replacements, removals and abandonments of pipe from all causes from the beginning of operations to July 1, 1933. The information secured from this exhaustive investigation has been summarized and made a part of this report in the form of schedules covering the replacement, removals and abandonment of pipe by years, lines and sizes of pipe.

A separate analysis has been made of all expenditures for repairs, replacements of fittings, reconditioning of lines and the installation of supplementary equipment of which collar leak clamps are a typical example. The information secured from this analysis has not been transferred from the work sheets.

A history has been compiled of each well (except wells in Petrolia Field) that has been connected to the Lone Star System since the beginning of operation. This history of wells has been divided into two parts, the first consisting of the history of each well that has been permanently disconnected from the system, and the second consisting of the history to date of each well that is now delivering gas to Lone Star Gas Company. The information secured from this investigation has been compiled in the form of schedules setting out the average life of disconnected wells by fields and the average life to date of the wells now in service.

The wells located in the Petrolia Field were not considered in the investigation due to certain unusual and purely local conditions which govern their present operation. The purpose of the study was to develop normal and average conditions and the inclusion of the Petrolia wells would have the effect of introducing an abnormality into the col- [fol. 9270] lection of basic data.

The operating history of each compressor station has been analyzed from the date of its installation to January 1, 1933, and from the information secured appropriate schedules have been prepared and made a part of the report.

The statistical records of the company with reference to the depreciation of automotive equipment is unusually complete and the information secured from this source has

been used with reference to the annual depreciation rate for automotive equipment.

Independent data secured from the results of investigations covering fifty two years and observations of more than 4,900,000 poles have been used in connection with the study of the depreciation rate of telephone line equipment. The data secured from this source were more complete than any information that the company records afforded and may be accepted as authoritative for this class of property.

The minor items of depreciable property have been analyzed for the purpose of determining the proportionate amount of the various types of depreciable property included in each group and the standard annual depreciation rates applicable to each types have been applied.

Where ever it has been apparent from historical consideration, or from the development of the probable life of gas reserves that certain items or groups of physical property would have a life expectancy as physical property which would exceed their service life in situ, the probable loss that would be incurred by abandonment or renewal has been applied as amortization calculated upon a sinking fund basis. In each case the probable salvage value of each prop- [fol. 9271] erty group has been ascertained from an analysis of the structural costs of typical examples of the property group and the estimated net salvage has been treated as a credit to the calculated reserve accrual.

Having in mind the extreme importance of the effect of the rate of growth of the physical property of Lone Star Gas Company upon the history of replacements and abandonments of property units and of the application of these replacements and abandonments expressed as a percentage of the property units to the property units of Lone Star Gas Company in service as of January 1, 1933, a complete analysis has been made of the rate of growth of Lone Star Gas Company expressed in terms of its major physical units subject to depreciation.

It will be understood that Lone Star Gas Company is a comparatively young property, that its oldest major property unit has been in service only twenty one years, that the property as a whole is composed of comparatively large individual units, and that a natural gas transportation company is normally subject to heavy abandonment charges at irregular intervals, and for these reasons it has been

impossible to develop comparatively smooth curves from mortality data.

Purpose of the Investigation

The primary object of the investigation has been the determination of a composite rate expressed as a percentage of the reproduction cost of the depreciable property of Lone Star Gas Company as of January 1, 1933, that should be accrued in order to protect the value of this property from all losses arising from physical deterioration, the cost of replacements, removals, abandonments, major [fol. 9272] rehabilitations and all other losses and costs of like character that will grow out of the future use in the public service of the specific property in service as of January 1, 1933.

As previously noted, the property of Lone Star Gas Company as of January 1, 1933, consisted of various types of physical property with highly variable individual mortality characteristics. As a further complication the particular service rendered by property items of the same type has had in the past and will continue to have in the future a material effect upon the depreciation requirements of these items. This fact is illustrated by the difference in the over-all reserve requirements for steel pipe laid as well lines compared with the reserve requirements for steel pipe laid as main lines.

The depreciable property of Lone Star Gas Company as of January 1,1933, consisted of a composite of property units that had reached various service lives as of this date with the consequent result that property units of the same type had reached various points in their individual mortality curves.

In the calculation of proper reserve requirements, all of these variable factors must be considered and each factor must be given its proper weight in the final determination. The property as a whole must be classified, not only as to the type of property in use, but also as to the service that the property units will be called upon to render. Where the basic mortality rate is a function of the passage of time this mortality rate must be determined, if possible, by the application of the mathematics of probabilities to the available historical data. Where replacements and removal losses grow out of changed operating conditions, future

[fol. 9273] occurrences of this nature must be measured in the light of past experience together with a proper consideration of conditions existing at the date of inquiry. Finally the service life, or life in service at the date of the investigation, of the major property items in service as of January 1, 1933, must be determined in order that a rational projection may be made of the reserve requirements for the future.

The foregoing statement summarizes in a general way some of the factors that must be considered in the fixing of an annual rate designed to provide for the cost of replacements, removals, abandonments and major rehabilitations in the depreciable property of Lone Star Gas Company as of January 1, 1933.

It must be clear in this connection that this study and the rate that may be developed from it is concerned solely with the future of the specific property units of the Lone Star Gas Company in use in the public service as of January 1, 1933, and not with any capital additions that may be made in subsequent years. Furthermore, it must be clear that any annual rate designed solely to cover the cost of replacements, removals, abandonments and major rehabilitations that will be required in the future in order to maintain this property in status quo, in reference to number of units and in one hundred per cent operating condition, will fail to provide for the inevitable decline in per cent condition of new that will take place in the property, and such an annual rate will fail to provide for the amortization of the ultimate loss that will inevitably take place at such time as the gas reserves commercially available to the markets now served by Lone Star Gas Company will have become depleted.

[fol. 9274] As of January 1, 1933, the per cent condition of the physical property of Lone Star Gas Company was relatively high and after an intensive examination by competent engineers, was fixed at approximately 93 per cent of new. This high per cent of new condition was due in a great measure to a large amount of capital additions made to the property within the past few years which have had the practical effect of reducing the weighted age of the property substantially below its total age, and also to the large amount of replacements made since 1910.

As before stated, the basic limitations of this study require that no consideration be given to the effect of future

capital additions to the present property. In other words, this study is of necessity confined to a projection of the present property into the future, maintained at one hundred per cent operating condition (as is of this date) but not augmented. Under these conditions there will be an inevitable decline in the per cent of new condition of the property of Lone Star Gas Company represented by the units in service as of January 1, 1933. Future capital additions will no doubt modify the rate of decline in per cent of new condition, or even eliminate it when the property as a whole is considered, but this factor can have no bearing upon the results of a study confined to the specific property items (or replacements of them) in service at the date of inquiry.

This gradual decline in per cent condition will be brought about by accrued physical deterioration which cannot be wholly offset by replacements and rehabilitations and will continue until a static condition is reached at which time the weighted per cent condition of the property units in service [fol. 9275] as of January 1, 1933, or their replacements, will be substantially less than the 93 per cent found by the engineers at the date of this inquiry.

Inasmuch as this inevitable loss in future value cannot be offset by renewals and periodic rehabilitations until it has reached a level substantially below 93 per cent, specific provision must be made by means of reserve accruals to cover this loss in value in addition to the reserve accruals designed to provide for the cost of replacements, removals, abandonments and major rehabilitations.

If the reserve accrued for this specific purpose is treated as an independent account, it will differ from the reserves accrued for the cost of replacements, renewals, abandonments and major rehabilitations in that no current withdrawals would be made from it. It would function theoretically at least as a fund created for the necessary purpose of providing the owners of the property with free capital in an amount equal to the sum that would be deducted from that portion of the rate base represented by the property units in service as of January 1, 1933, by reason of accrued depreciation found in the property at some future date.

As the fund represented by this reserve accrual must be free capital in order to offset loss, it follows that the ac-

cruals to it should be made upon a straight-line basis. The rate of the accrual should be measured by the approximate annual rate of decline in per cent condition of the property in service as of January 1, 1933, and the duration of the accrual as applied to the specific property units, or their replacements, in service as of January 1, 1933, should be measured by the time required for the property units to [fol. 9276] reach a static condition relative to per cent of new condition.

In the case of a natural gas production and transportation company whose service life in the final analysis is dependent upon the life of a mineral resource subject to ultimate depletion, a reserve accrual should be made to cover the property loss that will be brought about by the final abandonment of the enterprise. This loss will be represented by the loss of the value of the business as a going concern, together with the loss of that portion of the value of the physical property, less salvage, represented by the per cent condition of the physical units after they have reached a static per cent of new condition.

In the determination of present value for rate making purposes, no deduction from a rate-base should be made on account of so-called accrued amortization in a property subject to ultimate abandonment. For this reason any reserve made for the purpose of creating a fund designed to provide for loss due to ultimate abandonment should be accrued upon a sinking fund basis.

From the foregoing analysis it will be understood that the total annual reserve accruals necessary to protect the property of Lone Star Gas Company in service as of January 1, 1933, should provide for the losses growing out of the cost of replacements, removals, abandonments and major rehabilitations, the loss in property value growing out of a future decline from present per cent condition, and the loss that will be realized at the date of the depletion of available gas reserves.

It is not the purpose of this investigation to provide a basis for an accounting procedure in the matter of setting [fol. 9277] aside annual reserve accruals. It is strictly an engineering investigation of the history of the property to date, and an analysis of the mortality record of the various property units made for the purpose of estimating the future costs of depreciation and amortization as applied to

the property of Lone Star Gas Company as of January 1, 1933. As will be developed, these costs will fluctuate widely from year to year due to the characteristics of the physical units themselves and to the uncertainty surrounding various phases of the business. The purpose of reserve accruals is the anticipation of these fluctuations and the elimination of their effect upon current operating charges. The average rates suggested, will, therefore be based upon uniform annual accruals.

[fol. 9278] Lone Star Gas Company

Basic Rate—Steel Pipe

[fol. 9279] Steel pipe laid underground, together with the cost of collateral equipment constituted by far the major item of depreciable property in the property account of Lone Star Gas Company as of January 1, 1933.

In the appraisal of the property as of this date prepared by P. McDonald Biddison, E. A. Steinberger and Ed. C. Connor, the reproduction cost of lines, rights-of-way and equipment, exclusive of undistributed costs, was $34,604,312. The total reproduction cost of all physical property, exclusive of the value of developed and undeveloped leaseholds, was $47,733,536.

In view of this fact, it is evident that the determination of a basic annual rate to cover the probable mortalities in steel pipe that will be brought about by the production, gathering and transportation of natural gas by Lone Star Gas Company is the most important single factor in any study concerned with the fixing of annual reserve accruals for this particular property. In this connection, the basic annual rate may be defined as the annual accrual expressed as a percentage of the reproduction cost of the lines which will be required to provide for the cost of normal replacements, the loss by abandonments brought about by the use of the property and the passage of time, and the ultimate net loss in the specific units in service (or their replacements) at the date of this inquiry that will be brought about by the ultimate abandonment or fundamental modification of the enterprise.

Without investigation, it could be assumed that the characteristics of the physical mortalities of steel pipe in service in the system of Lone Star Gas Company would conform in

eneral way to the behavior of physical property units
l. 9280] whose rate of replacement due to inherent phys-
characteristics, is comparatively low during early serv-
years and comparatively rapid as the service years
roach the average life period of the units. It could also
assumed that the characteristics of the mortalities of
el pipe in service in the system of Lone Star Gas Com-
y would rather definitely follow the general trend of the
tality curve previously developed for steel pipe in serv-
in the system of Fort Worth Division—Lone Star Gas
npany.*

hese general assumptions provide the basis for the in-
l steps of the investigation. They were, however, sub-
to modification in several important particulars.

n the calculation of annual renewal rates for the replace-
nt of steel pipe from the basic data secured from a study
the operating history of Fort Worth Division—Lone
Gas Company, all replacements, removals and aban-
ments were included in the mortality analysis without
inction as to the causes of the replacements, removals
abandonments. It is certain that a substantial propor-
of the items from which the mortality curve and the
ribution curve of annual renewals were developed grew
of inadequacy, public requirements, changed operating
ditions, and other factors distinct from the physical
ure of the pipe itself. In general, these same factors
e a similar application to the pipe in the transportation
l. 9281] and gathering system of Lone Star Gas Com-
y.

a local distribution system wherein the individual
perty items replaced, removed or abandoned are rela-
ly small compared to the aggregate amount of these

---

* An exhaustive investigation has been made covering the
tality of steel pipe in the distribution system of the Fort
rth Division—Lone Star Gas Company. Very complete
a were available for this study from which mortality
ves covering a service experience of more than twenty-
ee service years were prepared. This study also in-
led the development of mortality curves of gas meters
service line pipe covering a service experience of more
n forty years. These studies were the first ever devel-
d for these specific property units.

items in the system taken as a whole, and where the rate of their occurrence as indicated by a study of their occurrence is a function of the passage of time, no material error will arise from a determination of the annual rate for depreciation by the method that was used in this particular analysis.

In this study, all of the pipe in the distribution system except pipe used for service connections was included and the mortality rate determined was assumed to apply to the system as a whole. The pipe in a local distribution system has but one general function—that of delivering gas from fixed points of receipt to individual consumers variously located on the distribution mains. It may be assumed as a normal operating condition that the points of receipt will remain fixed, or may be altered without material effect upon the local lines, and that gas will be delivered at proper pressure for local distribution throughout the life of the property as a natural gas distribution agency. Under these circumstances, the conditions affecting the mortality of pipe may properly be assumed to apply alike to all of the pipe in any given distribution system.

In the case of a pipe line system of a large natural gas producing, gathering and transporting system such as Lone Star Gas Company as of January 1, 1933, an estimate of the proper annual depreciation accruals for steel pipe must take into consideration several important factors that have no application in the determination of depreciation accruals [fol. 9282] for similar property items in local distribution systems.

The steel pipe in the Lone Star System may be divided into two general groups as follows:

1. Main Lines and Tap Lines

2. Field Lines and Well Lines

Unlike the pipe in a distribution system which may be treated as a unit, the necessary depreciation accruals for each of the above noted groups of pipe line classification will be directly affected by the type of service the pipe is called upon to render. For this reason, it will be necessary to treat each group as an independent property unit, and to give proper weight in each case to the controlling factors characteristic of the particular type of service rendered by the property group.

In the pipe line system of Lone Star Gas Company as of January 1, 1933, certain designated lines were relatively large compared to the system as a whole. This condition has existed in the past and will continue to exist in the future. The history of the company has demonstrated that in the case of designated main lines, changed operating conditions have brought about heavy reserve charges at irregular intervals due to the fact that large sections of lines, and in some cases lines — a whole, have been removed from their original locations and relaid in other locations more advantageously situated from an operating standpoint. These removals of main lines, and the assurance of similar removals at indeterminate future dates create a problem that has no particular relation to the basic mortality rate which is largely a function of use and the passage of time. For this reason, they must be treated as independent prob- [fol. 9283] lems together with the collateral question for the salvage value of the materials of construction transferred and relaid.

In the case of Field Lines whose service life in a given location will be in a measure dependent upon the production of gas from a limited area, the factor of loss caused by removals will be a most important element in the fixing of reserve accrual rates for this group of lines. In the case of well lines whose service life in a given location will be largely dependent upon the life of one or more gas wells, the factor of loss caused by removals will be a predominant element in the fixing of reserve accrual rates for this group of lines.

Fortunately for the purposes of this study, the history of the company in past years affords a fairly definite basis for an estimate of future probabilities with reference to the annual rate of removals for both Field Lines and Well Lines.

The history of Lone Star Gas Company also discloses the fact that heavy charges to the depreciation reserve account and other large expenditures not so charged have been incurred by reason of the wholesale overhauling and rehabilitation of large sections of lines. This work, in most cases, has been directed to the correction of joint failures and the renewal of pipe protection, and in every case the cost of labor has been the predominant element of expense.

Any study of mortality data that is confined to the replacement, removal and abandonment of pipe will fail to give proper consideration to the necessity for reserve accruals to cover recurring expenses of this nature.

From the foregoing facts, it will be clear that the neces- [fol. 9284] sary reserve accrual for steel pipe laid underground in the system of Lone Star Gas Company will be a composite figure determined by the cumulative effect of the basic mortality rate for steel pipe, the net cost of removals and abandonments brought about by changed operating conditions, the cost of major rehabilitations together with the loss in value due to the normal decline in per cent condition, and the ultimate loss brought about by the abandonment or basic modification of the enterprise.

[fol. 9285] Basic Mortality Data

Steel Pipe

[fol. 9286] For the purpose of developing basic mortality data for steel pipe in the system of Lone Star Gas Company, a complete analysis has been made of all available records having any bearing upon the historic replacement, removal or abandonment of pipe or lines from the beginning of operations in 1910 through the month of June, 1933. The results of this analysis have been made a part of this report in the following enumerated schedules and recapitulations:

1. Recapitulation of Pipe Replacements, Removals and Abandonments by Years, Sizes, and Feet of Pipe.

2. Main Line Replacements, Removals and Abandonments by Lines, Years, Sizes and Feet of Pipe.

3. Tap Line Replacements, removals and Abandonments by Lines, Years, Sizes, and Feet of Pipe.

4. Field Line (Gathering Line) Replacements, Removals and Abandonments by Lines, Years, Sizes, and Feet of Pipe.

5. Well Line Replacements, Removals and Abandonments by Lines, Years, Sizes, and Feet of Pipe.

6. Consolidated Summary of Main Line and Tap Line Replacements, Removals and Abandonments by Years, Sizes and Feet of Pipe.

7. Consolidated Summary of Well Line and Field Line (Gathering Line) Replacements, Removals and Abandonments by Years, Sizes, and Feet of Pipe.

In each schedule and recapitulation, the feet of pipe of the various sizes replaced, removed or abandoned have been reduced to a length of pipe expressed in terms of equivalent three inch diameter pipe.

In prior years, it had been the practice of the accounting section of Lone Star Gas Company to make no recorded distinction between the replacements, removals and abandonments of Tap Lines and the replacements, removals and abandonments of the particular designated Main Line of which the Tap Lines have been an integral part. For this [fol. 9287] reason, it was possible to identify and segregate only a portion of the mortalities specifically attributable to Tap Lines, the other portion of the mortalities having been included as a part of the replacements, removals and abandonments of Main Lines.

In order that the effect of this former practice of the accounting section might be eliminated, the mortalities of Main Lines and Tap Lines have been consolidated as has the footage of pipe in use for various service years in both property groups. This consolidation is a logical one inasmuch as the Main Lines and Tap Lines constitute an integral transportation unit having uniform service characteristics as distinguished from the service characteristics of that portion of the pipe line system used in the production and gathering phases of the business.

What has been said relative to the former practice of the accounting section with reference to the recorded mortalities of designated Main Lines and the mortalities of Tap Lines having the same basic designation is also true of the recorded mortalities of certain Gathering Lines and Well Lines connected to these Gathering Lines. For this reason, the mortalities of Field Lines (Gathering Lines) and Well Lines have been consolidated as has been the footage of pipe in use for various service years in both property groups. This consolidation is also a logical one inasmuch as Field Lines and Well Lines have similar service characteristics and constitute an integral production and gathering unit.

An inspection of these schedules discloses the fact that the replacements, removals and abandonments of pipe in

lines designated as Main Lines and Tap Lines constituted [fol. 9288] the major portion of the replacements, removals and abandonments of all pipe in service since 1910. Furthermore, as has been previously noted and as will be subsequently developed in detail, the designated Main Lines and Tap Lines have not been so materially affected by abandonments as has been the case with reference to Field Lines and Well Lines whose service life in situ has been more or less determined by the life of limited gas producing areas and frequent changes in operating conditions brought about by the lack of uniformity in the decline of well pressures and volumes.

While large sections of the major lines as well as the Tap Lines have been removed and relaid as other designated lines, these removals can be identified and thus segregated from the other data. In view of the fact that more definite consideration can be given to the data that are applicable to the development of true mortality curves, the history of Main Line and Tap Lines only has been used in the calculations upon which the mortality curve has been based.

The tabulation—Main Line Replacements, Removals and Abandonments, shows that 5,362,659 feet of three inch equivalent diameter pipe have been replaced, removed or abandoned in the designated Main Lines of Lone Star Gas Company from 1910 to July 1, 1933. This tabulation, as previously noted, includes some mortalities that are in fact attributable to certain Tap Lines. This inaccuracy is corrected by the tabulation which consolidates the mortalities of Main Lines and Tap Lines.

This tabulation does not include all of the historic mortalities in the designated Main Lines for the reason that the very early records of the company do not furnish voucher authority for the inclusion of certain outright abandonments of pipe in Line A, and for the further reason that no [fols. 9289-9293] replacements, removals or abandonments in pipe line properties acquired by purchase by Lone Star Gas Company, and which replacements, removals and abandonments were made by other owners prior to the date of purchase, have been included in this study.

The tabulation—Tap Line Replacements, Removals and Abandonments, shows that 703,966 feet of pipe of three inch equivalent diameter have been replaced, removed or abandoned in the designated Tap Lines of Lone Star Gas Com-

pany from 1910 to July 1, 1933. This tabulation as previously noted does not include certain mortalities that are in fact attributable to the pipe in Tap Lines, but which have been included as a part of the mortalities of Main Lines. This inaccuracy is corrected by the tabulation which consolidates the mortalities of Main Lines and Tap Lines.

[fols. 9314-9321] Definitions

The primary objects of this phase of the investigation are the determination of the probable future rate of failure of steel pipe in service in the pipe line system of Lone Star Gas Company, caused primarily by the physical condition of the pipe, and the probable future rate of replacements, removals and abandonments of pipe, or lines caused primarily by changed operating conditions, or by public requirements.

The probable future rate of failure, and the probable future rate of replacements, removals and abandonments have been estimated from the distribution curves of annual replacements, removals and abandonments developed from primary mortality curves independently determined for mortalities caused primarily by the physical condition of the pipe, and for mortalities caused primarily by changed operating conditions, or public requirements.

As previously noted, the rate of failure of pipe caused primarily by the physical condition of the pipe, when expressed as a percentage of the amount of pipe in service, will be a function of the passage of time. This rate will be a variable percentage that will increase as the indicated average life period of the pipe is reached, and will become the predominant factor in the total annual rate required as the age of the property increases.

* * * * * * *

[fol. 9322] Development of Mortality Curves and Distribution Curves

Mortality Curve I, and Distribution Curve I

During the year 1931, a mortality curve was developed for steel pipe in service in the system of Lone Star Gas Company. The purpose of the development of this curve was to fix the basis for an estimate of the probable future rate of failure of steel pipe in service due primarily to physical causes. From this primary mortality curve, there was also developed a distribution curve of annual failures of original units. The ordinates of this curve for each service year corresponded to the increase in mortality percentage of original units for corresponding service years as determined by the slope of the mortality curve. Calcula-

tions were also made reflecting the effect of replacements of replacements upon the distribution curve of the replacement of original units. These calculations covered a period of fifty-two service years.

In this report, these curves are shown in the graph—Lone Star Gas Company Depreciation Analysis—Mortality Curve I.

The calculations covering the effect of replacement of original units, and replacements of replacements is shown in the calculation—Calculation of Total Annual Renewal Rates. These renewal rates are based solely upon the Mortality Curve I.

The ordinates taken from the distribution curve of the annual replacements of original units, and the distribution curve of the annual replacements of original units and replacements of replacements are also shown in tabular form in the tabulation—Annual Renewal Rates Steel Pipe—Lone Star Gas Company, from Mortality Curve I.

[fol. 9339] Allocation of Historic Mortalities and Determination of Effective Service Years

In order that the Primary Test could be applied to any mortality curve under investigation, it was necessary:

First. To make an allocation of the historic mortalities of steel pipe in the Main Lines and Tap Lines of Lone Star Gas Company from 1910 to July 1, 1933, this allocation to consist of a distribution of the total mortalities to Major Removals to Major Replacements due primarily to changed operating conditions, or public requirements, and to mortalities due primarily to the physical condition of the pipe.

Second. To determine the effective service life of the Main Lines and Tap Lines in service in the system of Lone Star Gas Company prior to January 1, 1933, together with the effective service life of such lines as had been in service but which had been replaced prior to January 1, 1933, and for which lines replacements, removals and abandonments have been included in the total mortalities for Main Lines and Tap Lines.

The necessity for the determination of these basic factors grows out of the fact that the Primary Test for Mortality Curve I is based upon the application of the cumulative percentage of mortalities for given service years determined by the slope of the curve to the amount of pipe in Main Lines and Tap Lines having the corresponding effective service years, and to the further fact that the amount of pipe determined by this application should be in approximate agreement with the amount of pipe allocated to mortalities due primarily to physical causes.

[fol. 9340] In the case of the Mortality Curves II and III, the Primary Test is based upon a determination of the amount of pipe involved in the mortalities allocated to Major Removals and Major Replacements due primarily to changed operating conditions and other like causes, and a determination of the effective weighted service years of the pipe in Main Lines and Tap Lines affected by these removals and replacements during their service life.

Allocation of Historic Mortalities Steel Pipe—Main Lines and Tap Lines

In the 6,066,627 feet of three inch equivalent diameter pipe replaced, removed or abandoned in the designated Main Lines and Tap Lines of Lone Star Gas Company from

1910 to July 1, 1933, there has been included a substantial amount of pipe involved in major removal and major replacements caused primarily by changed operating conditions.

The major removals consisted of a series of removals that involved the designated Main Lines 2nd B and D, and the designated Tap Line D-2. A careful investigation has been made of each of these removals, and all available information relative to the ultimate disposition and use of the pipe removed has been used in connection with the allocation of mortalities.

As previously noted in the case of the removal of the sixteen inch pipe in Line 2nd B, and the twelve inch pipe in Line D, the pipe removed, less the amount of pipe junked at the removal date, was relaid in the Main Line System as a part of Lines G and H. In the case of the removal of the Tap Line D-2, the pipe removed, less the amount of pipe junked, was relaid as Tap Line F-2.

The major replacements due primarily to changed oper- [fol. 9341] ating conditions, or to public requirements, consisted of a series of replacements of pipe of various sizes and at various dates. The line designation and the amount of pipe expressed in feet of three inch equivalent diameter pipe replaced and allocated to Major Replacements, due primarily to changed operating conditions, or to public requirements, are shown in the following summary:

Year	Line Designation	Feet of 3 inch Equivalent
1912	Line A	222,945
1917	Line A	129,710
1920	Line A	16,000
1922	Line B-9	66,665
1923	Line A	443,649
1926	Line F-2	35,225
1927	Line F-1	25,727
1927	Line F-2	22,510
1928	Line A	256,667
1929	Line GD	104,147
1930	Line 153	14,896
1930	Line 86	14,256
1931	Line 17	50,148
1931	Line 24	57,840
1931	Line C	112,991
1933	Line J-2	17,067

Little, if any, of this pipe replaced can be identified as having been subsequently relaid as a part of the Main Line System. As shown by the records of the company, a substantial part of the pipe removed was junked on removal and as indicated by the experience of the company, additional amounts were classified as junk, or as unfit for main line service subsequent to the transfer of the salvaged material to warehouse stock as second-hand pipe.

As in the case of the pipe involved in Major Removals, an exhaustive examination has been made of all available records for the purpose of determining the ultimate disposition and use of the pipe replaced in the operations designated as Major Replacements caused by changed operation conditions and by public requirements. The results of these investigations have been used in connection with the [fol. 9342] allocation of mortalities.

It is evident that when the removal of a line, or a portion of a line takes place, and a portion of the pipe is junked at the time of removal, the pipe thus junked should be added to the footage of pipe in the classification representing mortalities caused primarily by the physical condition of the pipe in service. This is also true with reference to the footage of pipe junked in connection with major replacements caused primarily by changed operating conditions, or to public requirements.

While as previously stated, it has been the experience of the company that when second-hand pipe is taken from lines and transferred to warehouse stock, that approximately ten per cent of such pipe is finally classified as unfit for service. No consideration has been given to this fact in fixing the amount of pipe having been removed by reason of physical condition. The line designation and the amount of pipe expressed in feet of three inch equivalent diameter pipe classified as junked in connection with Major Removals and Major Replacements caused primarily by changed operating conditions, or by public requirements, is set out with the following summary:

Year	Line Designation	Feet of 3 inch Equivalent
1912	Line A	16,017
1916	Line D-2	232
1917	Line H (Line D)	38,017
1917	Line C	4,528
1917	Line A	880

Defendant's Exhibit No. 42—Continued

Year	Line Designation	Feet of 3 inch Equivalent
1922	Line B-9	2,800
1923	Line A	18,280
1923	Line A	23,238
1926	Line F-2	2,844
1927	Line F-2	338
1928	Line A	71,266
1929	Line GD	5,693
1930	Line 86	1,327
1930	Line 151	6,347
1930	Line J-2	972
1931	Line 17	5,196
1931	Line 24	1,426

[fol. 9343]

1931	Line 24	8,434
1931	Line C	18,443
1933	Line J-2	1,365

The results of these allocations of the total mortalities of steel pipe in the designated Main Lines and Tap Lines in the system of Lone Star Gas Company from 1910 to July 1, 1933, are set out in the tabulation—Allocation of Main Line and Tap Line Replacements, Removals and Abandonments —1910 to July 1, 1933.

With these allocations completed, the sum of the footage in Columns B and D, or 4,290,424 feet of three inch equivalent diameter pipe is the total amount of pipe removed or replaced in the designated Main Lines and Tap Lines of Lone Star Gas Company from 1910 to July 1, 1933, primarily by reason of changed operating conditions, or public requirements. The amount of footage in Column G, or 2,003,846 feet of three inch equivalent diameter pipe is the total amount of pipe removed or replaced in the designated Main Lines and Tap Lines of Lone Star Gas Company from 1910 to July 1, 1933, primarily by reason of the physical condition of the pipe.

The allocation of the mortalities by years as set out in the tabulation are also shown in graphic form—Main Line and Tap Line Replacements, Removals and Abandonments of Pipe by Years. In this graph are shown:

1. The annual replacements and abandonments of Main Line and Tap Line pipe caused primarily by the physical condition of the pipe.

2. The major removals and replacements due primarily to changed operating conditions, or to public requirements equally distributed in annual installments beginning one year subsequent to the individual removal or replacement and extending through the year 1933.

In the graph, these annual allocations have been added to [fol. 9344] the annual replacements and abandonments caused primarily by the physical condition of the pipe.

It will be noted from an inspection of the graph that the results as shown with reference to historic replacements and abandonments due primarily to the physical condition of the pipe, are typical of the normal behavior of steel pipe with the exception of the relatively high mortalities during some of the earlier service years where a substantial amount of pipe was junked incident to Major Removals and Major Replacements caused primarily by changed operating conditions. This condition is noticeable in the years 1912, 1915, 1916, 1917, 1923 and 1925. This pipe would have been removed at some later date had the lines remained in place, but the replacements would no doubt have been more normally distributed over the subsequent years.

Attention should also be directed to the low rate of replacements during th war period and to the obviously abnormally low rate of replacement during the year 1932. This latter condition was the result of the effort of Lone Star Gas Company to conserve its cash resources during this period, and the replacements made during the year 1932 do not reflect a normal situation. Consideration has not been given to this particular fact in the calculations made with reference to a test of the adopted mortality curve.

Column F—Feet of Three Inch Equivalent Diameter Pipe Junked in Connection with Major Removals and Major Replacements.

Conclusion

The following summary sets out in condensed form a comparison of the various checks of the adopted mortality [fol. 9402] curves, and the total historic mortalities of steel

*Feet of three Inch Equivalent Diameter Pipe.

pipe in the pipe line system of Lone Star Gas Company from 1909 to mid-year, 1933, all in feet of three inch equivalent diameter pipe.

Calculated Mortalities:

1. Main Lines and Tap Lines:	
a. Mortality Curve I	2,044,522
b. Mortality Curve II	4,125,739
2. Field Lines and Well Lines:	
a. Mortality Curve I	120,332
b. Mortality Curve III	1,797,998
Total Calculated Mortalities	8,088,591

Historic Mortalities:

1. Main Lines and Tap Lines:	
a. Mortalities due to failure of pipe	2,003,846
b. Mortalities due to changed operating conditions	4,290,424
2. Field and Well Lines:	
a. Mortalities due to failure of pipe	120,332*
b. Mortalities due to changed operation conditions	1,715,688
Total Historic Mortalities	8,130,290

* Calculated.

If consideration is given to the fact that included in the mortalities of Main Lines and Tap Lines, due to changed operating conditions, there is a certain amount of pipe that was junked incident to the replacement or removal, the historic mortalities become 7,902,647 feet of equivalent diameter pipe, or 97.7 per cent of the mortalities derived from an application of the renewal rates developed from the adopted mortality curves. In this connection, no consideration has been given to conditions that existed in 1932 with reference to the curtailment of practically all replacements and removals. For convenience, the calculated as well as the historic mortalities have been set out by years in graphic form in the graph—Calculated and Historic Mortalities—By Years.

[fols. 9405-9407] Part I of this report has been confined to a general discussion of the scope of the investigation, the basic mortality data with reference to steel pipe in the system of Lone Star Gas Company, and to a development of three basic mortality curves for steel pipe in service in the system of Lone Star Gas Company.

Mortality Curve I was the mortality curve developed for steel pipe in Main Lines and Tap Lines and indicated the cumulative percentage of failures for various service years brought about primarily by the physical condition of the pipe. This curve was designed to apply to all steel pipe in the system insofar as failures due to physical condition were concerned.

Mortality Curve II was the mortality curve developed for steel pipe in Main Lines and Tap Lines and indicated the cumulative percentage of replacements, removals and abandonments for various service years brought about primarily by changed operating conditions and other like causes. This curve was designed to apply specifically to steel pipe in Main Lines and Tap Lines.

Mortality Curve III was the mortality curve developed for steel pipe in Field Lines and Well Lines and indicated the cumulative percentage of replacements, removals and abandonments for various service years brought about by changed operating conditions and other like causes. This curve was designed to apply specifically to steel pipe in Field Lines and Well Lines.

From each of these mortality curves, there were developed distribution curves of replacements of original units and replacements of replacements for various service years.

These mortality curves and the annual replacement, or renewal rates derived from them, expressed as a percentage [fol. 9408] of the units in service were tested by a comparison of the calculated mortalities based upon the respective slopes of the curves for various service years with the actual mortalities properly allocated that had taken place in the Main Lines, Tap Lines, Field Lines and Well Lines of Lone Star Gas Company from the beginning of operations through July 1, 1933.

Part II of this report is confined to a development of the future annual reserve accruals, expressed as a percentage of the reproduction cost of the units in service that will be required to provide for the cost of replacements of steel pipe due primarily to physical condition of the pipe, the

cost of replacements, removals and abandonments due primarily to changed operating conditions, or to public requirements, to provide for the decline in per cent of new condition and to provide for the cost of major rehabilitations in the Main Lines, Tap Lines, Field Lines and Well Lines in service in the system of Lone Star Gas Company as of January 1, 1933.

[fol. 9409] Annual Rate of Reserve Accrual

Main Lines and Tap Lines

[fol. 9410] The total annual reserve accrual required for Main Lines and Tap Lines, exclusive of amortization accruals applicable to the property as a whole, is based upon the cumulative effect of four major factors.

1. The annual rate of reserve accrual required for steel pipe for failures caused primarily by the physical condition of the pipe.

2. The annual rate of reserve accrual required for Main Lines and Tap Lines required to cover the cost of replacements, removals and abandonments caused primarily by changed operating conditions, or by public requirements.

3. The annual rate of reserve accrual required to cover the cost of periodic major rehabilitations of Main Line and Tap Line pipe.

4. The annual rate of reserve accrual required to create a credit balance sufficient to offset the difference in present value as determined by visual inspection and future value determined by the same method at such time as the per cent of new condition of the property will have become static.

Item 1:

The limit of the annual rate (when expressed as a percentage of the units in service) required for steel pipe for failures caused primarily by the physical condition of the pipe, was found to be four per cent per annum. This percentage is the limit of the oscillating type of distribution curve of annual replacements of original units and replacements of replacements derived from Mortality Curve I.

It is obvious from an inspection of the tabulation—Annual Renewal Rates for Steel Pipe from Mortality Curve I,

that the percentages for annual renewal rates of original units and replacements of replacements will not be four per cent during the period under review, but will be a series of [fol. 9411] variable percentages increasing from zero per cent at one service year to a maximum of 7.24 per cent at the twenty-seventh service year; then decreasing to another minimum of 2.55 per cent at the thirty-eighth service year; then again increasing to another maximum of 5.08 per cent at the fifty-first service year. This oscillation will continue with decreasing amplitude as the service years increase until at some future date a uniform rate of four per cent per annum will be reached.

In order to estimate the effect of the application of these variable percentages to the pipe in service as Main Lines and Tap Lines as of January 1, 1933, a calculation has been made wherein the applicable annual percentages have been applied to the miles of three inch equivalent diameter pipe in service in Main Lines and Tap Lines which had reached the corresponding service years. This calculation was extended from the year 1933 through the year 1955, and the results are shown in the calculation—Calculated Future Annual Replacements—Main Lines and Tap Lines, from Mortality Curve I—Table I-A.

For convenience, and for reference, the results of this calculation are set out in the following summary:

Year	Calculated Miles 3 Inch Equivalent	Per cent of Miles in Service
1934	102.29	.99
1935	124.94	1.21
1936	146.48	1.42
1937	168.42	1.64
1938	192.82	1.87
1939	220.38	2.14
1940	244.90	2.38
1941	266.64	2.59
1942	292.08	2.84
1943	420.56	3.11
1944	345.82	3.36
1945	370.23	3.60
[fol. 9412]		
1946	398.72	3.87
1947	432.98	4.20

Year	Calculated Miles 3 Inch Equivalent	Per cent of Miles in Service
1948	469.96	4.56
1949	509.30	4.95
1950	547.48	5.32
1951	571.23	5.55
1952	584.37	5.68
1953	588.61	5.72
1954	578.77	5.62
1955	552.80	5.32

The average annual rate for the twenty-two year period for which the calculations have been made, expressed as a percentage of miles of three inch equivalent diameter pipe in service as Main Line and Tap Lines in the system of Lone Star Gas Company as of January 1, 1933, is 3.54 per cent. The average annual rate, if the calculations are projected sufficiently beyond 1955, will approach four per cent as a limit.

Attention should be called to the fact that the miles of three inch equivalent diameter pipe to which the various annual rates have been applied in Table I-A have been assigned the service years indicated by the date of original installation with the exception that the indicated age of Lines B, C, G and H has been adjusted to compensate for the effect of the renewal of protective coating.

Item 2:

The limit of the annual rate (when expressed as a percentage of the units in service) required for steel pipe in Main Lines and Tap Lines for the cost of replacements, removals and abandonments caused primarily by changed operating conditions, or by public requirements, was found to be 1.6 per cent per annum. This percentage is the limit of the oscillating type of distribution curve of annual replacements, removals and abandonments, and replacements of replacements derived from Mortality Curve II. An in- [fol. 9413] spection of the tabulation—Annual Renewal Rates for Steel Pipe from Mortality Curve II discloses the fact that the annual renewal rates of original units and replacements will not be 1.6 per cent during the period under review, but will be a per cent that gradually increases from .80 per cent to 1.136 per cent for the forty-fifth service year. The distribution curve from which these percentages

were derived is of the oscillating type, but in this case, the extent of the first life cycle (125 service years) eliminates the effect of any oscillations during the period under review.

In order to estimate the effect of the application of these variable percentages to the pipe in service as Main Lines and Tap Lines as of January 1, 1933, a calculation has been made wherein the applicable annual percentages have been applied to the miles of three inch equivalent diameter pipe in service as Main Lines and Tap Lines which had reached corresponding service years. As in the case of Item I, this calculation was extended from the year 1933 through the year 1955, and the results are shown in the calculation—Calculated Future Annual Replacements, Removals and Abandonments—Main Lines and Tap Lines, from Mortality Curve II—Table II-A.

For convenience, and for reference, the results of this calculation are set out in the following summary:

Year	Calculated Miles 3 Inch Equivalent	Per cent of Miles in Service
1934	88.78	.86
1935	89.50	.87
1936	90.21	.88
1937	90.93	.88
1938	91.66	.89
1939	92.40	.90
1940	93.11	.90
1941	93.88	.91
[fol. 9414]		
1942	94.62	.92
1943	95.39	.93
1944	96.13	.93
1945	96.91	.94
1946	97.68	.95
1947	98.45	.96
1948	99.24	.96
1949	100.05	.97
1950	100.82	.98
1951	101.48	.99
1952	102.44	.99
1953	103.31	1.00
1954	104.11	1.01
1955	104.93	1.01

The average annual rate for the twenty-two year period for which calculations have been made, expressed as a percentage of miles of three inch equivalent diameter pipe in service as Main Lines and Tap Lines in the system of Lone Star Gas Company is .94 per cent. The average annual rate, if the calculations are sufficiently projected beyond the year 1955, will approach 1.6 per cent as a limit.

Attention should be called to the fact that the miles of three inch equivalent diameter pipe to which the various annual rates have been applied in Table II-A are not adjusted with reference to service years by reason of the renewal of the protective coating on Lines B, C, G and H for the reason that the renewal of the protective coating will not affect the probability of replacement, removal, or abandonments caused by changed operating conditions, or by public requirements.

Attention should also be called to the future relation between the calculated annual percentages for Item 1 and Item 2. It was stated in Part I of this report that as the age of the pipe increased, the annual renewal rate required for the replacement of pipe caused primarily by the phys- [fol. 9415] ical condition of the pipe would become the predominant factor in the total annual rate. This fact is clearly demonstrated by the results of the calculations in Table I-A, and Table II-A.

Item 3:

From 1910 to 1933, Lone Star Gas Company expended approximately $570,000 for major rehabilitation of Main Lines and Tap Lines. Costs of this character will normally tend to increase with the passage of time and the consequent increase of the age of the lines, but the history of the company affords no basis for any rational projection of such increases into the future. The actual expenditures in the past, expressed in dollars per mile of three inch equivalent diameter pipe per service year was $5.99 ($570,000 divided by 95,071 miles service years of three inch equivalent diameter pipe). This expenditure expressed as a percentage of the reproduction cost of Main Lines and Tap Lines, reduced to a cost per mile of three inch equivalent diameter pipe ($2,960) is approximately .202 per cent per annum. This percentage has been adopted as the an-

nual rate of reserve accrual required to provide for the future cost of major rehabilitations.

Item 4:

All depreciable property of Lone Star Gas Company in service as of January 1, 1933, will be subject to a gradual decline in per cent of new condition below the average per cent of new condition found by the engineers as the per cent of new condition of the property as of January 1, 1933.

With specific reference to the property in service as of January 1, 1933, and with no consideration given to the [fol. 9416] effect of future capital additions upon the average per cent of new condition of the property as a whole at any future date, the per cent of new condition will decline to an average per cent of new of approximately eighty per cent.

When proper consideration is given to the weighted service years of the Main Lines and Tap Lines in service as of January 1, 1933, the annual rate of this decline as found by the engineers of the company, when expressed as a per cent, has been slightly in excess of one per cent per weighted service year. This average annual rate of decline in per cent of new condition will not be a continuous one as is indicated by the fact that a static per cent of new condition will ultimately be reached and thereafter maintained. For this reason, an annual rate of one per cent for fifteen years has been included in the calculation of reserve accruals for Main Lines and Tap Lines.

Determination of the Annual Rate

The annual rate of reserve for Main Lines and Tap Lines should provide the basis for the estimate of the average annual future costs of replacements, removals and abandonments from all causes, the cost of major rehabilitations and the loss in value due to the future decline in per cent of new condition.

The word, "Cost" is of particular significance in connection with this study. The calculations and the estimates that have previously been made have had to do solely with the "Rate" of occurrences, and in all of the preceding calculations, this rate has been expressed as a percentage per

annum of the units in service. Inasmuch as it is the function of the annual reserve accruals to provide for certain "Costs", it becomes necessary to translate the annual rates expressed as percentages of units by property into an an-
[fol. 9417] nual sum of money representing the cost of replacements, removals and abandonments and other factors that should be provided for through the medium of reserve accruals.

The commonly accepted method by which this translation is made is by the application of the average rates of occurrence expressed as a percentage of the units in service to the reproduction cost of the property units under consideration. This simple procedure can provide a rational answer to the problem only if the average rate of replacements, removals and abandonments, expressed as a percentage of units when applied to the reproduction cost of the units, results in a sum approximately equal to the unit cost of the replacements, removals and abandonments. The following example is illustrative of this fact.

Let it be assumed that the Main Line pipe in a given system is uniform in diameter and that the reproduction cost is three dollars per lineal foot installed. Let it be further assumed that this pipe has reached a service life that requires that uniform annual replacement of four per cent of the footage of pipe in service in order to maintain the number of units in service. In this case, the annual accrual created by the application of four per cent (the rate of failure) to three dollars (unit reproduction cost) and the number of feet in service will provide the proper replacement accrual in terms of dollars only when the net unit cost of making the necessary replacements is three dollars per lineal foot.

On the other hand, in the case of replacements and removals caused primarily by changed operating conditions, or by public requirements, the element of the net salvage value of the material recovered and removed is a factor that must be weighed and taken into consideration in con-
[fol. 9418] nection with the final expression of the annual reserve accrual.

Inasmuch as the application of a percentage to reproduction cost is the only practical method by which reserve accruals, expressed in terms of dollars per annum, may be estimated, the following factors in addition to the annual

rates expressed as a percentage of the units in service, must be taken into consideration.

1. The proportionate part of the reproduction cost of the property units (Main Lines, Tap Lines and their appurtenant equipment) as a whole not subject to replacements, removals or abandonments, nor subject to a decline in per cent of new condition.

2. The net salvage value of the materials removed and recovered.

3. The relative cost of replacements, unit basis, and the reproduction cost of the units replaced, unit basis.

If a substantial proportion of the reproduction cost of a property unit is not subject to replacement, removal, or abandonment, nor to a decline in per cent of new condition, and the mortality rate for this unit has been determined from a study of the portion of the unit subject to depreciation and replacement, then the application of the rate to the reproduction cost of the unit as a whole would result in the accrual of an annual sum in dollars that would be in excess of the requirements for which the specific reserve has been created.

If it is assumed that the Main Lines and Tap Lines of Lone Star Gas Company in service as of January 1, 1933, will remain in their original locations throughout their service lives, the items included in a reproduction cost estimate of direct structural costs that would be unaffected by the factor of replacements, removals and abandonments that would be unaffected by a decline in per cent of new condi- [fol. 9419] tion and that would not be reincurred in piecemeal replacements are as follows:

1. Value of lands owned in fee.

2. Rights-of-way costs exclusive of construction damages.

3. Reproduction cost of clearing rights-of-way.

If total costs instead of direct structural costs are considered, a large proportion of the undistributed general charges would not be reincurred in piece-meal replacements. This is particularily true of the item—Interest During Construction.

In an appraisal of the Main Lines and Tap Lines of Lone Star Gas Company made as of January 1, 1932, in-

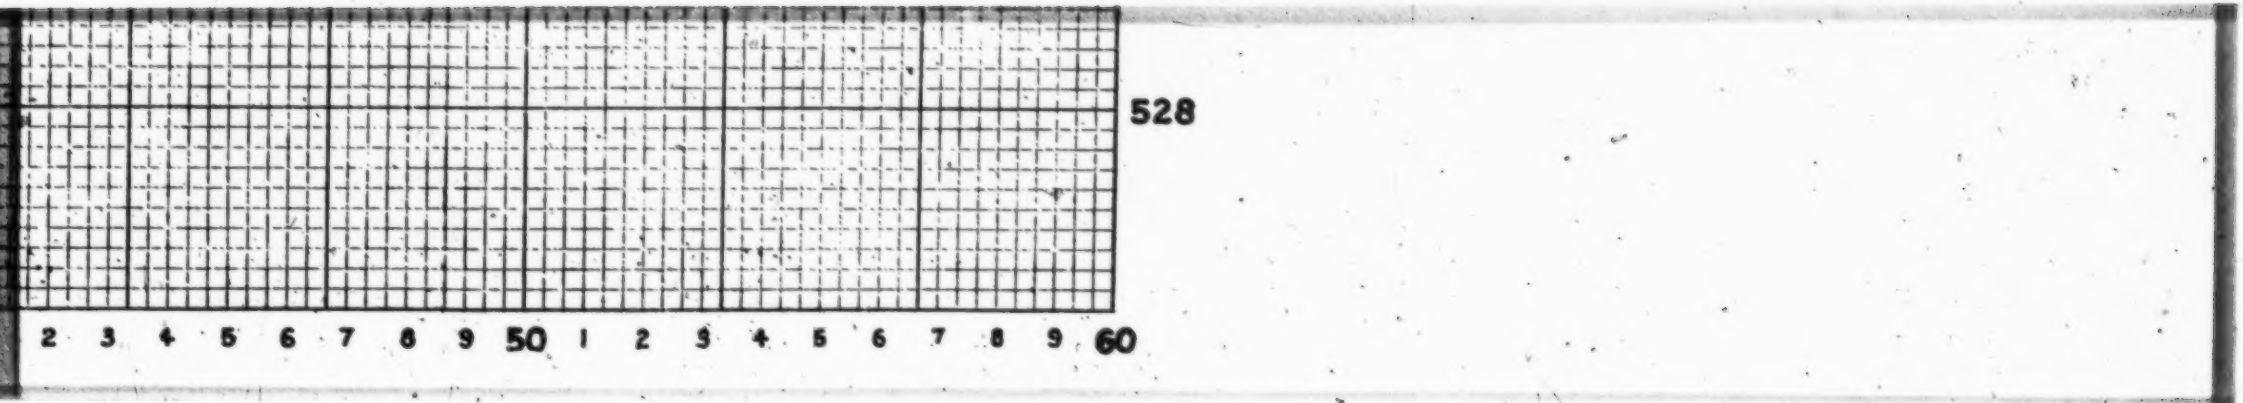
volving direct structural costs of approximately $33,000,000, the following items should be classified as non-depreciable in the sense that in the replacement of units of property, these original costs would not be proportionately reincurred.

Measuring Station Land	$50,000
Rights-of-way	1,180,000
Other transmission land	14,000
Total	$1,244,000

The indicated percentage of the direct structural costs of Main Lines and Tap Lines not subject to the application of the annual reserve rates is 3.78. For the purpose of this determination, 96 per cent of the Main Lines and Tap Lines will be used as the proportionate part of the reproduction cost of these property groups subject to the application of that portion of the reserve accrual designed to provide for the replacement of pipe due primarily to the physical condition of the pipe, and for the decline in per [fol. 9420] cent of new condition. That portion of the total annual reserve accrual designed to provide for replacements, removals and abandonments due primarily to changed operating conditions, or to public requirements, will be applied to 100 per cent of the reproduction cost of the Main Lines and Tap Lines for the reason that new rights-of-way will be required for the changed location of the lines. That portion of the total annual reserve accrual designed to provide for the cost of major rehabilitations will be applied to 100 per cent of the reproduction cost of the Main Lines and Tap Lines for the reason that the annual percentage use for this factor has been based upon the relation of the cost of major rehabilitations to the entire reproduction cost of Main Lines and Tap Lines including rights-of-way and land.

It has been impossible from an analysis of records to determine the net value of salvable material involved in the replacement, removal, or abandonment of the Main Lines and Tap Lines of Lone Star Gas Company.

It is certain that the proportionate part of the total annual reserve accrual, designed to provide for the cost of future replacements due primarily to the condition of the pipe will be largely unaffected by the factor of net salvage value. On the other hand, it is equally certain that pipe



528
2 3 4 5 6 7 8 9 50 1 2 3 4 5 6 7 8 9 60

replaced, or removed by reason of changed operating conditions will have a certain net salvable value that will tend to reduce the indicated reserve accrual determined by the number of feet of replaced, or removed, expressd as a percentage of the feet in service.

In order to make a rational estimate of the effect of net salvage upon the indicated reserve accruals, a study has [fol. 9421] been made of the actual cost of construction items of forty-five lines involving an expenditure of $4,548,487, and for this study, a determination has been made of the net salvage that might be recovered upon the removal of a line in case it is assumed that the pipe and fittings recovered are in 100 per cent of new condition after reconditioning.

The result of this analysis is shown in the tabulation—Determination of Salvage Value—Main Lines, Tap Lines and Field Lines—Table III-A.

In this tabulation, Column A sets out in detail and by items the installation cost of these lines. Column B sets out the percentage of each item of construction cost that would be lost in connection with a replacement, removal or abandonment of the lines as a whole. Column C sets out in detail and by items the dollar loss indicated by the application of the percentages in Column B to the installation cost of the corresponding items in Column A. Column D sets out the percentage of the cost of the original construction items that would be involved in recovering the pipe and fittings on removal and the cost of refilling the ditches and transferring the salvaged material to warehouse stock.

As shown by the tabulation, the estimated net loss is approximately 70 per cent of the original installed cost based upon the assumption that the salvaged material is in 100 per cent of new condition at the date of removal.

It will be noted in Column B that 25 per cent of the original cost of the pipe is the estimated per cent of the cost of the pipe lost on removal. This percentage of loss is intended to cover

1. The loss in footage due to cutting.

2. The cost of preparing ends for relaying.

[fol. 9422] 3. The cost of cleaning and reconditioning after removal.

As a result of the foregoing analysis, a factor of .70 has been adopted as applicable to the indicated annual rate estimated to provide for replacements, removals and abandonments due primarily to changed operating conditions, or to public requirements.

In order to make a rational estimate of the effect of the excess cost of piece-meal replacements in lines over the estimated unit cost of installation, based upon a wholesale reproduction cost estimate, a study has been made of the actual costs involved in making piece-meal replacements.

In all, the costs of two hundred and one individual replacement jobs were analyzed. These jobs covered the replacements of four, six, eight, ten, twelve, sixteen and eighteen inch threaded and coupled, Dresser coupled and welded pipe. The individual replacements ranged from twenty feet to thirty-five thousand feet in length. A total of 665,000 feet of three-inch equivalent diameter pipe was involved in the replacements investigated, and the labor costs exceeded $232,000.

The comparative analysis was limited to the direct structural costs used in the reproduction cost estimate of the pipe lines of Lone Star Gas Company as of January 1, 1932, prepared by E. A. Steinberger and Ed. C. Connor, and it was assumed that there would be no material difference in the cost of materials used in replacements and the unit cost of the same materials used in the reproduction cost estimate. In order that the comparison between the direct structural costs (less material) for similar units used in the reproduction cost estimate might be exact, the unit cost of the identical lines in which the replacements [fol. 9423] were made were taken from the reproduction cost estimate and these unit costs were compared with the cost of piece-meal replacements in the same lines. The ratio of the unit costs developed by the reproduction cost estimate and the corresponding unit costs developed by the analysis of the cost of the piece-meal replacements was 1.00 to 1.61.

This analysis also developed the fact that there is a sharp increase in the unit cost of replacements as the length of the individual replacements is reduced. The effect of this increase in the unit cost of replacements (labor only) with the reduction in the length of the replacements is shown in the graph—Graphic Comparison of Unit Costs of Replace-

ments—Steel Pipe—Labor Only, With Unit Costs—Reproduction Cost Estimate.

Due to the clearly defined characteristics indicated by this graph, it was necessary to select for this study a group of replacement jobs that would be representative with reference to length of the average length that will be met in future replacements.

This analysis also developed the fact that included in the cost of a number of the replacement jobs analyzed, there were certain costs, indeterminate in amount, that were not strictly attributable to the cost of making the replacement itself. In order to safely compensate for the inclusion of these extraneous charges, the indicated ratio of the unit cost developed by the reproduction cost estimate and the unit cost developed by the analysis of the cost of piece-meal replacements (1.00 to 1.61) has been reduced to 1.00 to 1.50.

There remains to be considered the effect of the net salvage value of materials recovered in replacements made [fol. 9424] primarily by reason of the physical condition of the pipe upon the indicated annual rates shown in Table I-A (Annual Rates from Mortality Curve I—1934-1955).

It is certain that pipe removed from Main Lines and Tap Lines by reason of its physical condition will have a per cent of new condition substantially lower than 100 per cent. It is also true that this pipe will have a minimum value measured by its value as junk and a maximum value measured by its adaptability for use in other parts of the system where service conditions are not so exacting as those imposed by Main Line Service.

In the analysis of the cost of piece-meal replacements, all items of expense were included in the unit costs developed. These unit costs, therefore, included the estimated cost of recovery shown in Column E—Table III-A, and such salvage as might be attributable to the material recovered would be a net credit to the cost of piece-meal replacements.

From Column A—Table III-A, the cost of pipe and fittings (new) was 64 per cent of the total installed cost of the forty-five lines analyzed. The cost of pipe and fittings (new) then becomes 42.7 per cent of the cost of the piece-meal replacements (64 per cent divided by 1.50). If it is assumed that the pipe and fittings removed, primarily on account of the physical condition of the pipe, have an average salvable value of 50 per cent of new pipe and fittings, this salvable value becomes 21.35 per cent of the total unit

cost of piece-meal replacements, and when credited to this unit cost, reduces the ratio of 1.50 to 1.00 (the ratio to the unit cost of piece-meal replacements to the unit cost of wholesale reproduction) to 1.18 to 1.00. The factor 1.18 [fol. 9425] will, therefore, be applied to all annual renewal rates developed from Mortality Curve I and shown in Table I-A, together with the factor .96 previously developed to provide for the proportionate part of the reproduction cost of Main Lines and Tap Lines not subject to replacement due to the physical condition of the pipe.

This concludes the discussion of the various factors required to reduce the indicated future rates of replacements, removals and abandonments derived from the mortality curves and distribution curves of annual renewals or replacements to annual rates, which when applied to the reproduction cost of Main Lines and Tap Lines, will properly reflect the effect of the proportionate part of these property groups not subject to replacement, the effect of the salvable value of materials recovered, and the effect of the excess unit costs of piece-meal replacements over the corresponding unit costs in wholesale reproduction.

Table IV-A sets out in detail the results of the application of the factors to the basic annual rates. For convenience and reference, the results of this application are shown in the following summary:

Year	Main Lines and Tap Lines Adjusted Total Annual Rates
1934	2.882 Per cent
1935	3.140
1936	3.389
1937	3.638
1938	3.899
1939	4.215
1940	4.487
1941	4.734
1942	5.018
1943	5.334
1944	5.617
1945	5.899
1946	6.215
1947	6.589

[fol. 9426]

Year	Main Lines and Tap Lines Adjusted Total Annual Rates
1948	6.996
1949	6.488
1950	6.918
1951	7.178
1952	7.325
1953	7.381
1954	7.277
1955	6.938

These future annual rates are expressed as percentages per annum, which when applied to the reproduction cost new of Main Lines and Tap Lines in service in the system of Lone Star Gas Company as of January 1, 1933, are designed to provide for

1. The future net Cost of replacements and abandonments due primarily to the physical condition of the pipe.

2. The future net Cost of replacements, removals and abandonments due primarily to changed operating conditions, or to public requirements.

3. The value lost through future decline in per cent of new condition.

4. The future cost of major rehabilitations.

It will be noted that the calculated annual rates are a series of variables. It was stated in the preceding section of this report that the primary function of the reserve accrual finally determined would be to provide a uniform rate of accrual that would fulfil the indicated requirements.

It is obvious that a uniform annual accrual designed to provide the necessary annual funds indicated by the application of the adjusted total annual rates to the reproduction cost of Main Lines and Tap Lines, will create a credit balance during the earlier years of the accrual. The use of this credit balance, and the interest earned upon it, would tend to reduce the indicated amount of the uniform annual accrual.

[fol. 9427] Consideration has been given to this fact in fixing the uniform annual rate. The average annual rate

from 1934 to 1955 inclusive is 5.53 per cent. The average annual rate adopted is 5.40 per cent.

In Table V-A, there is set out the effect of applying five per cent interest compounded annually to the credit balance derived from deducting the calculated annual rates from the adopted uniform annual accrual, 5.40 per cent. It will be noted from an inspection of the tabulation that the credit balance increases to a maximum of 19.32 per cent in 1946, and thereafter declines to 12.49 per cent in 1955 due to the excess of the estimated charges over the uniform annual accrual. The credit balance would have been entirely dissipated had the calculations been carried forward through the year 1965. The credit balance at no time would be free capital.

[fol. 9438] Annual Rate of Reserve Accrual

Field Lines and Well Lines

[fol. 9439] All of the general factors covered in the discussion of the determination of the Annual Rate of Reserve Accrual—Main Lines and Tap Lines, are applicable to the determination of the annual rate of reserve accrual for Field Lines and Well Lines.

The application of the annual rates required for the failures of pipe due primarily to the physical condition of the pipe from Mortality Curve I to each of the Field Lines and Well Lines in service as of January 1, 1933, giving proper effect to the age of each line and the consequent position of its units on Mortality Curve I, resulted in the following calculated annual rates from 1934 to 1955 inclusive.

Defendant's Exhibit No. 42—Continued

Year	Calculated Miles 3 Inch Equivalent	Per cent of Miles in Service
1934	6.77	.43
1935	8.37	.53
1936	10.31	.66
1937	12.56	.80
1938	15.08	.96
1939	18.12	1.15
1940	21.76	1.39
1941	26.10	1.66
1942	31.03	1.98
1943	36.43	2.32
1944	41.62	2.65
1945	47.28	3.01
1946	53.45	3.40
1947	60.11	3.83
1948	66.05	4.21
1949	71.60	4.56
1950	77.82	4.96
1951	84.81	5.40
1952	91.04	5.80
1953	94.61	6.02
1954	94.93	6.05
1955	93.60	5.96

The details of the above calculations are shown in the tabulation—Calculated Future Annual Renewal Rates—Field Lines and Well Lines, from Mortality Curve I—Table VI-A.

The application of the annual rates required for replace-
[fol. 9440] ments, removals and abandonments due primarily to changed operating conditions from Mortality Curve III to each of the Field Lines and Well Lines in service as of January 1, 1933, giving proper effect to the age of each line and the consequent position of its units on Mortality Curve III resulted in the following calculated annual rates from 1934 to 1955 inclusive.

Defendant's Exhibit No. 42—Continued

Year	Calculated Miles 3 Inch Equivalent	Per cent of Miles In Service
1934	57.83	3.65
1935	59.04	3.76
1936	60.81	3.87
1937	62.62	3.99
1938	64.53	4.11
1939	66.42	4.23
1940	68.44	4.36
1941	70.48	4.99
1942	72.61	4.62
1943	74.82	4.76
1944	76.97	4.90
1945	78.95	5.03
1946	81.31	5.18
1947	83.69	5.33
1948	85.51	5.45
1949	88.04	5.61
1950	90.58	5.77
1951	93.07	5.93
1952	95.83	6.10
1953	98.40	6.27
1954	99.21	6.32
1955	103.02	6.56

The details of the above calculations are shown in the tabulation—Calculated Future Annual Replacements, Removals and Abandonments—Field Lines and Well Lines, from Mortality Curve III—Table VII-A.

In the case of Field Lines and Well Lines, no annual allowance has been included to cover the future cost of major rehabilitations.

The decline in per cent of new condition in Field Lines and Well Lines will conform to the decline in per cent of new in the property as a whole and the annual rate of one [fol. 9441] per cent is, therefore, included as a part of the total annual rate of reserve accrual—Field Lines and Well Lines.

As in the case of Main Lines and Tap Lines, certain factors must be applied to the annual rates based upon the estimated future rate of occurrence expressed as a percentage of the units in service in order to compensate for the salvable value of material recovered, the excess cost of piece-meal replacements over unit costs developed from a wholesale reproduction cost estimate, and the percentage of the property units not subject to depreciation or replacement.

The estimate for each of these factors is based primarily upon the analysis made for the corresponding factors for Main Lines and Tap Lines with certain modifications made necessary by the service conditions applicable to Field Lines and Well Lines.

1. Salvable value of materials recovered—replacements, removals and abandonments due to changed operating conditions.

In the case of Main Lines and Tap Lines as developed from the detail analysis in Table III-A, the loss in removals wherein the condition of the material removed was assumed to be 100 per cent of new was found to be 70 per cent of the total installed cost. In the case of Field Lines and Well Lines, the same analysis has been used with the reduction of the per cent of new condition of the material removed to 75 per cent of new, and an estimated cost of 25 per cent of this amount for reconditioning, loss of footage, repair of pipe ends and other like costs. This adjustment results in an estimated loss of 82 per cent of the original installation cost. This factor, .82, will be applied to all calculated future annual rates from Mortality Curve III.

[fol. 9442] 2. Excess cost of piece-meal replacements over unit costs developed by wholesale reproduction cost estimate.

From the analysis of the actual cost of piece-meal replacements, it was determined that the ratio of the unit costs of such replacements to corresponding unit costs, wholesale reproduction basis, was 1.50 to 1.00. It was also determined that the cost of pipe and fittings (new) was 42.7 per cent of the total cost of piece-meal replacements. When replacements are made in Field Lines and Well Lines by reason of the physical condition of the pipe, the pipe removed will not have the same potential salvable value as pipe removed from

Main Lines and Tap Lines for similar reasons. In the estimate made for Main Lines and Tap Lines, an extremely liberal estimate of 50 per cent of new was placed on the pipe replaced by reason of physical condition. In the estimate for Field Lines and Well Lines, this estimated salvable value has been reduced to 30 per cent of new. This allowance, which is liberal for this factor, reduces the net salvable for Field Lines and Well Lines to 12.8 per cent (42.7 per cent times 30 per cent), and fixes the factors necessary to provide for the increased cost of piece-meal replacements at 1.308 (1.50 x .872). This factor will be applied to the future annual renewal rates developed from Mortality Curve I in order to translate the annual rate based upon the future rate of occurrence to the future "cost" of annual replacements expressed as a percentage of reproduction cost new, Field Lines and Well Lines.

3. Percentage of reproduction cost not subject to replacements or depreciation.

In the case of Main Lines and Tap Lines, an analysis of the cost of rights-of-way and lands, which items are not sub-
[fol. 9443] ject to replacement in piece-meal replacements, or replacements due primarily to the physical condition of the pipe or to depreciation, were found to be approximately four per cent of the total installed cost of Main Lines and Tap Lines. For Field Lines and Well Lines, the proportionate part of the total investment represented by non-depreciable items is approximately one per cent of the total installed cost. The factor, .99, will, therefore, be applied to the annual rates from Mortality Curve I, and the annual percentage designed to provide for the future decline in per cent of new condition.

This concludes the discussion of the various factors required to reduce the indicated future rates of replacements, removals and abandonments from the mortality curves and distribution curves of annual renewals or replacements to annual rates, which when applied to the reproduction cost of Field Lines and Well Lines, will properly reflect the effect of the proportionate part of these property groups not subject to replacement, the effect of the salvable value of materials recovered; and the effect of excess unit costs of piece-meal replacements over corresponding unit costs in wholesale reproduction.

Table VIII-A sets out in detail the results of the application of the factors to the basic annual rates. For convenience and reference, the results of this application are shown in the following summary:

Year	Field Lines and Well Lines Adjusted Total Annual Rates
1934	4.540 per cent
1935	4.759
1936	5.018
1937	5.298
[fol. 9444] 1938	5.603
1939	5.948
1940	6.365
1941	6.822
1942	7.342
1943	7.897
1944	8.440
1945	9.013
1946	9.641
1947	10.321
1948	10.911
1949	10.505
1950	11.154
1951	11.856
1952	12.513
1953	12.937
1954	13.017
1955	13.097

These future rates are expressed as percentages per annum, which when applied to the reproduction cost new of Field Lines and Well Lines in service in the system of Lone Star Gas Company as of January 1, 1933, are designed to provide for:

1. The future net Cost of replacements and abandonments due primarily to the physical condition of the pipe.

2. The future net Cost of replacements, removals and abandonments due primarily to changed operating conditions.

3. The value lost through future decline in per cent of new condition.

It will be noted the calculated annual rates are a series of variables. As in the case of the total annual reserve accrual estimated for Main Lines and Tap Lines, the corresponding accrual for Field Lines and Well Lines has been determined as a uniform rate of accrual that will fulfil the indicated requirements.

As in the case of the calculations for Main Lines and Tap Lines, a uniform annual accrual designed to provide the necessary annual funds indicated by the application of the [fol. 9445] adjusted total annual rates to the reproduction cost of Field Lines and Well Lines will create a credit balance during the earlier years of the accrual. The use of this credit balance, and the interest earned upon it, will tend to reduce the indicated amount of the uniform annual accrual.

Consideration has been given to this fact in fixing the uniform annual rate. The average annual rate from 1934 to 1962, inclusive, is 9.38 per cent. The uniform annual rate adopted is 8.60 per cent.

In Table IX-A, there is set out the effect of applying five per cent interest compounded annually to the credit balance derived from deducting the calculated annual rates from the adopted uniform annual accrual, 8.60 per cent. It will be noted from an inspection of the tabulation that the credit balance increases to a maximum of 39.53 per cent in 1947, and thereafter declines to 10.00 per cent in 1968 due to the excess of the estimated charges over the uniform annual accrual in the later years. The credit balance would have been absorbed had these calculations been carried to approximately forty-five years beyond 1934. The credit balance at no time would be free capital.

* * * * * * *

[fol. 9463] Method of Annual Reserve Calculation—Gas Well Construction and Equipment

In the preceding discussion, consideration has been given to some of the difficulties encountered when an attempt is made to anticipate the mortality of existing gas wells and to estimate the probable rate of failure and abandonment

of wells to be drilled in the future, whether drilled in developed or in unproven areas.

A brief analysis has also been made of some of the factors that control the functions of reserve accruals designed to offset the decline in rated capacity and to provide for the ultimate loss of a group of producing gas wells. In this analysis, it was shown that, considered primarily as a group of units of physical property, a given number of wells might remain in service over a given number of years without the failure of any individual well during this interval. It was also shown if such a condition did exist, a dimunition of ratable capacity per well would inevitably take place during the interval and that the rate of this dimunition in ratable service capacity would be controlled by the rate of gas withdrawals rather than by the passage of time.

If the capital outlay involved in that part of the property of Lone Star Gas Company required to bring its gas reserves into possession is to be recovered by means of a reserve accrual, it is obvious that this reserve accrual in the aggregate should have a definite relation to the total volume of gas that may be brought into possession by means of the facilities provided for recovery. If the unit of production is M cubic feet of gas, it follows that the loss created by the withdrawal of a unit of production will be the reproduction cost of gas well construction and equipment [fol. 9464] of an individual well, divided by the total volume of recoverable gas expressed in terms of M cubic feet of gas that may ultimately be produced by this well. If the reproduction cost of gas well construction and equipment is a known factor and the volume of gas which can be recovered by means of the well and equipment can be estimated with comparative accuracy, then the simple mathematical process above outlined will fix the unit accrual rate in terms of cents per M cubic feet of gas that will be ultimately produced.

What has been said with reference to an individual well is equally applicable to a group of wells, and if similar determinations are made with reference to cost and expected recovery, a weighted accrual rate for the group expressed in terms of M cubic feet of withdrawals can be established.

In order to maintain the status quo of the ratable delivery capacity of gas wells owned and operated by Lone Star Gas Company and to deplete its developed reservoirs, the

group of wells in service as of January 1, 1933, must be supplemented by other wells with which to offset the inevitable decline which will take place in the ratable capacity of the wells in service as well as to permit complete depletion of the producing areas not fully developed at January 1, 1933. Normally, the first additional wells will be drilled in proven areas not fully developed. As the development of the present proven areas reaches saturation, the necessary supplementary drilling will be extended to other areas now classified as undeveloped. If the maintenance of the status quo alone is considered, this process will continue as a series of recurring cycles. If an increase in demand is considered, or if the demand remains constant, and if by reason of changed operating conditions the demand upon [fol. 9465] the production of company owned wells is increased, then in either case the processes of the cycle will be accelerated.

In the calculation of reserve accruals for any specific property, consideration must be given to the manner in which the operating charges of the company are handled and in the case of Gas Reserves and Gas Well Construction and Equipment, equal consideration must be given to the manner in which these property items have been treated in a reproduction cost estimate, or in the property base expressed in terms of dollars to which the accrual rates are to be applied.

In the reproduction cost estimate of the property and business of Lone Star Gas Company as of January 1, 1933, the gross value of the developed gas reserves of the company were determined upon the basis of the application of a determined unit value per M cubic feet to the volume of recoverable gas in the developed and defined reservoirs owned by the company. From this gross value there was deducted the reproduction cost now of all gas wells now owned and operated by the company together with the cost of all future drilling that will be required in the specific areas in order to secure a complete and ratable recovery from these reservoirs.

In order to make this evaluation of gas reserves, it was necessary, not only to determine the volumetric content of the reservoirs in M cubic feet of gas and the average unit value of gas after recovery, but it was also necessary to fix an average annual withdrawal rate for the purpose of

applying the proper discount factors to the unit value of the gas after it had been recovered.

[fol. 9466] It will be clear from this brief explanation that by the method of valuation adopted, there has been established a balanced relation between the gross value of the gas reserves owned by Lone Star Gas Company as of January 1, 1933, and the reproduction cost new of Gas Well Construction and Equipment as of that date as well as the cost of future drilling in the areas under consideration. The deduction of the full reproduction cost new of all gas wells now in service as well as the cost of future wells, from the gross value of the reservoirs, with no consideration given to the remaining life expectancy or potential production from any well requires that the amount thus deducted from the gross value of reserves be recovered during the period of depletion.

A careful determination has been made of the total delivery of gas in M cubic feet from all wells which have been attached to the system of Lone Star Gas Company, but which have been abandoned by reason of the practical exhaustion of their reservoirs. A careful determination has likewise been made of the recoverable gas in the gas reserves included in the reproduction cost estimate of property of the company as producing leaseholds. This determination has been made by Mr. F. E. Kendrick, Chief Geologist, Lone Star Gas Company, and Mr. J. H. Dunn, Production Engineer, Lone Star Gas Company. Mr. Dunn has also prepared a schedule of future drilling for the Shamrock, Leeray and Sipe Springs districts. All of this essential information has been available in connection with the preparation of this report.

The following schedule sets out the reproduction cost new of Gas Well Construction and Equipment in the various areas wherein Lone Star Gas Company owns gas reserves.

[fol. 9467]

Field	Cost per Well	Number of Wells	Total
Chickasha	$16,380.45	43.00	$704,359
Duncan	13,614.91	8.50	115,727
Fox (Loco)	8,248.38	6.50	53,614
Panhandle (Shamrock)	15,062.48	78.00	1,174,874
Petrolia	11,264.99	46.00	518,190
Cheaney	24,270.61	18.00	436,871
Leeray	30,991.21	42.19	1,307,442
Sipe Springs	22,359.99	8.00	178,880
Miscellaneous Wells	23,555.88	11.25	265,004
Total		261.44	$4,754,961

The following schedule sets out the estimate of the recoverable reserves owned by Lone Star Gas Company in the various fields and the estimated number of additional wells that will be required to recover these reserves.

Field	Additional Wells	Estimated Cost	Reserves M. Cubic Feet
Chickasha	...	...	1,877,000
Duncan	...	...	461,000
Fox (Loco)	...	...	270,000
Miscellaneous (Oklahoma)	...	...	1,390,000
Panhandle (Shamrock)	86	$1,295,332	211,000,000
Petrolia	...	...	1,877,000
Cheaney	...	...	1,800,000
Leeray	36*	1,115,676	123,570,000
Sipe Springs	18	402,480	19,000,000
Miscellaneous (Texas)	...	...	5,300,000
Total,	140	$2,813,488	366,545,000

* Includes five wells now producing gas but not included in the current appraisal.

The reproduction cost of the present wells, $4,754,961, together with the estimated cost of the future wells, $2,813,488, indicates a total cost of $7,568,459 for Gas Well Construction and Equipment required to recover 366,545,000 M cubic feet of gas.

The estimated unit cost of recovery is, therefore, $.0206 per M cubic feet of gas produced.

[fol. 9468] In connection with the foregoing determination, the following comment is offered: the total estimated production per well including the estimated additional wells required for the future development of the present producing areas is approximately 913,000 M cubic feet per well. An analysis of the total production from 502 gas wells which have been attached to the system of Lone Star Gas Company but which have been abandoned by reason of the depletion of their respective reservoirs hsows that the average total production from company owned wells has been 91,773 M. cubic feet, and that the average total production from other owned wells has been 180,079 M. cubic feet. The weighted total average production from all wells abandoned prior to January 1, 1933, has been 165,126 M. cubic feet. The basis of these calculations is set out in detail in the tabulations showing total deliveries of abandoned gas wells.

Mr. Dunn in his estimate of the number of wells that will be drilled in the future in the Sipe Springs, Leeray and Shamrock Districts has confined his estimate to the number

of wells required to conform to the lease obligations of the company and has given no consideration to an increase in the number of wells above this minimum that might be brought about by reason of future needed availability.

A primary function of a reserve accrual is the elimination of irregularities in current operation charges which will be caused by the variable rates of property, replacements and capital losses. In the case of an annual reserve accrual designed to provide for the uniform recovery of capital expenditures subject to the type of loss characteristic of the failure of gas wells, it is necessary to accrue [fol. 9469] this reserve at a uniform rate determined by the average rate of delivery over a period of years during which a rational estimate of average deliveries can be made.

As of January 1, 1933, the wells owned and operated by Lone Star Gas Company furnished approximately forty-two per cent of the potential capacity of all natural gas wells attached to the system. This ratio of potential delivery capacity of company owned wells has constantly increased since the Petrolia Field ceased to be a material factor as a source of supply and every known factor indicates that this ratio will continue to increase in the future.

The tabulation showing the number of company owned wells and the relation of gas produced from company owned wells to the amount of gas purchased from 1917 to 1932 inclusive clearly indicates the trend towards a higher ratio of gas produced to gas purchased.

An analysis of the facts disclosed by the tabulation gives a complete insight into the various phases of the development of the present gas supply of Lone Star Gas Company and an appreciation of the effect of the changes that have taken place in this phase of the company's operations since 1917. During the year 1917, 90 per cent of the total gas purchased and produced came from the production of company wells in the Petrolia Field. The rapid decline of this source of supply during the years immediately following 1917 and the effect of the attachment of independent gas production in Southern Oklahoma in 1918 is indicated by the rapid decline in per cent of gas produced and the corresponding increase in the percentage of gas purchased during the years 1918, 1919, 1920, 1921 and 1922.

During the year 1925, the volume of residue gas secured [fol. 9470] from casing head gasoline plants first became

an important factor as a source of supply and during that year the percentage of gas produced reached the minimum figure of 8.93 per cent of the total gas.

After the marked decline of the Petrolia Field and until the beginning of the year 1928, the production from company owned wells was relatively small compared to the production from casing head plants and other owned natural gas wells. During 1927, the production of the company was largely drawn from the depleted reserves of the Petrolia area and the Loco, Duncan and Walters Districts in Southern Oklahoma. During the latter part of 1927, the company began an active program of gas development together with the purchase of producing gas wells which has resulted in the situation with reference to potential production from company owned wells that exists as of this date. The increase in the number of company owned wells exclusive of Petrolia, from 45 in 1927 to 222 in 1933, is not fully indicative of the increased capacity of company owned wells. The total open flow of company owned wells in 1927 was 159,777 M. cubic feet. In 1932 the total open flow of company owned wells was 2,433,983 M. cubic feet—an increase of 1500 per cent.

The full effect of the normal increase in the ratio of produced gas to purchased gas is not reflected in the tabulation. It will be noted that there has been a decline of approximately 10,000,000 M. cubic feet in total deliveries from 1929 to 1933 due largely to a corresponding decline in industrial gas sales. It has been the policy of Lone Star Gas Company to secure its base load requirements from casing head plants for the reason that if this gas is not currently utilized, it will otherwise be wasted. Due to this fact, the decline in the amount of gas secured from casing head [fol. 9471] plants reflects a decline in potential deliveries from this source rather than a proportionate decline in deliveries due to a decline in market requirements. The history of casing head plants as a potential source of supply will be discussed in detail.

In addition to the increase in capacity to deliver previously discussed, certain other factors will have a direct bearing upon the future increase in the proportionate amount of total deliveries secured from company owned wells.

Incidental production of gas developed in connection with the exploration for oil has in the past been the most fruitful source of independent gas production. Practically every area now reached by the gathering system of Lone Star Gas Company is practically devoid of any prospects in profitable future oil production. Inasmuch as natural gas production per se cannot support wild cat operations on the part of independent producers, the practical elimination of prospective oil production in the areas reached by Lone Star Gas Company will sharply restrict independent wild catting for oil production and will correspondingly reduce the volume of gas available for purchase during future years.

Another important factor will also tend to increase the proportionate amount of the total market requirements that will be furnished by company owned wells. As indicated by the tabulation, the production of casing head gas in West Texas has, since 1924 furnished Lone Star Gas Company with a substantial part of its base load requirements. The general condition of the oil and gasoline markets has practically stopped any additional development for the production of gasoline from casing head gas in the areas reached by Lone Star Gas Company and there has been a steady [fol. 9472] decline in the potential deliveries from this source. The supply of casing head gas which has provided an annual average of approximately 15,000,000 M. cubic feet of purchased gas will soon cease to be a material factor with reference to the base supply of gas.

The history of the delivery of residue gas to Lone Star Gas Company from casing head gasoline plants is shown in two tabulations: Tabulation Showing Detail of Casing Head Gas Purchased by Years in M. Cubic Feet and Tabulation Showing Decline in Production of Casing Head Gas Major Sources of Supply Lone Star Gas Company.

While the detail tabulation of total deliveries shows a decline from a maximum production in 1927 of 17,641,453 M. cubic feet to 10,324,783 M. cubic feet in 1932, this indicated decline does not reflect the actual rate of decline in potential deliveries from this source due to the fact that additional plants have been attached during various years from 1924 to 1932. The second tabulation clearly sets out the actual potential decline that has taken place in the major sources of supply that have been in service continuously

since 1924. The relative annual deliveries from these sources, which have furnished the major portion of all residue gas purchased, have declined from 100 per cent (maximum delivery) in 1925 to 30.9 per cent in 1932.

A further study of the rate of decline in the potential delivery capacity of the sources of supply of casing head gas available to the various plants now connected to the system of Lone Star Gas Company is now being made by Mr. J. H. Dunn. The final results of this investigation are not available at this time, but sufficient progress has been made to indicate that the rate of decline indicated by the figures used herein are indicative of the rate of decline [fol. 9473] of casing head gas as a future source of supply for Lone Star Gas Company.

In addition to an increase in the ratio of the total market requirements that company owned wells will be called upon to produce by reason of the cumulative effect of the factors previously discussed, there will be a normal increase in the total market requirements due in part to the growth of the market and in part to some revival in general business conditions. Any horizontal increase in market requirements will also be reflected correspondingly in the volume of gas to be supplied by means of company owned wells.

It is impossible to make an exact estimate of the proportional part of the total deliveries that will in the future be supplied by means of the gas wells included in this estimate and the cost of which must be recovered by means of the reserve accrual set up. It is not difficult, however, in view of the information contained in the available data, to fix an average annual rate of future delivery which will be clearly within the limits of probable future results. This average annual rate of future deliveries has been fixed at 20,000,000 M. cubic feet. This rate of delivery contemplates the practical depletion of developed gas reserves of Lone Star Gas Company as of January 1, 1933, over a period of approximately nineteen years.

The estimated average annual sum required to recover the cost of gas well construction and equipment necessary for the ratable depletion of the developed reserves of Lone Star Gas Company as of January 1, 1933 is, therefore, $.0206 (estimated unit loss per M. cubic feet of gas produced) times 20,000,000 cubic feet (average annual with-

drawals—company owned wells on present producing areas) or $412,000.

[fol. 9474] Decline in Per Cent of New Condition

The average annual decline in per cent of new condition found by inspection to be applicable to the physical property of Lone Star Gas Company was approximately one per cent per annum of weighted age. Included in the property to which this decline in per cent of new condition applied was $3,894,317 for the direct physical costs of Gas well construction and equipment in service as of January 1, 1933. This rate of decline in per cent of new condition (as applied to the property in service as of January 1, 1933, without consideration of the effect of future capital additions) will continue until a static per cent of new condition is reached. The provision for this loss as applied to gas well construction and equipment will require an annual accrual of $38,943 for a period of approximately fifteen years following January 1, 1932.

Effect of Salvable Value of Equipment

The calculations from which the per cent of value lost on the abandonment of gas wells has been determined is shown in the tabulation—Determination of Salvable Value —Gas Well Construction and Equipment. As shown in this tabulation, which is based upon the experience of Lone Star Gas Company in the matter of the various items of construction costs as well as in the matter of the percentage of materials recovered on well abandonment, the loss on abandonment without consideration of the loss in value of the recovered materials, is 84.5 per cent of the direct structural costs. Included in the deductions from the gross value of gas reserves for the cost of gas well construction and equipment required for recovery was an item of 22.1 per cent of direct structural costs to cover General or Undistributed Costs. All general costs will be necessarily lost [fol. 9475] on abandonment. An adjustment for this fact places the per cent of loss on abandonment at 87.29 per cent of the total installed cost including general costs.

The estimated proportion of the total cost of gas well construction and equipment as shown in the tabulation, together with an allowance of 22.1 per cent for General Costs, represented by the gross value of the casing and

fittings recovered was found to be 18.41 per cent. The decline in worth of this equipment upon final recovery will not be less than 33.3 per cent of value new, or an additional loss of 6.14 per cent expressed as a percentage of total installed cost. This additional loss due to the final condition of recovered material when added to the estimated loss of 87.29 per cent results in a total estimated loss of 93.43 per cent of the total installed cost of Gas Well Construction and Equipment.

Conclusion

The final determination of the annual reserve accrual required for Gas Well Construction and Equipment may be summarized as follows:

Annual allowance for recovery of Physical Property and General Costs $.0206 x 20,000,000	$412,000
Annual allowance for decline in per cent of new condition	38,943
Total Annual Allowance	$450,943
Estimated percentage of total cost lost	93.43
Net Calculated Annual Reserve Accrual	$421,316

The method of calculation which has resulted in the estidated annual reserve accrual required for gas well construction and equipment shown in the above summary develops an annual sum for the accrual substantially less than would have been developed had gas wells been treated from [fols. 9476-9479] the standpoint of items of physical property and the mortality experience of gas wells been applied.

In the foregoing calculations, however, the obvious inconsistencies and the innumerable uncertainties that would necessarily have entered into any calculation based upon the average life of gas wells have been largely eliminated.

The number of wells in service as of January 1, 1933, was a matter of exact determination. The reproduction cost of these wells including general costs has been estimated in a manner which precludes the possibility of any material error finding its way into the estimate. The reserve calculations have been carefully made and have been based upon an accumulation and an assimilation of data which are complete and reliable. If there has been an over estimate of the recoverable reserves, this error has resulted in a

reduction in the estimated annual accrual rate. The number of future wells required for recovery has been based upon the leasehold obligations of Lone Star Gas Company rather than upon a consideration of these obligations, together with additional drilling that future needed availability may require and to this extent the estimate is of necessity a conservative one. The estimated future average annual production from company owned wells, while not based upon data as exact in character as those which controlled the other phases of the estimate, was nevertheless based upon a careful study of the effect of every factor that will have a bearing upon the future ratio of purchased and produced gas.

[fol. 9485] Reserve Accrual for Gas Well Construction and Equipment Based on Mortality Data for Gas Wells

No report of this character would be complete unless it contained in summary form at least the available historical data relative to the actual mortalities of gas wells. The historical data herein contained permits the complete analysis of the performance to date of more than 500 producing gas wells now attached to the system of Lone Star Gas Company and the complete mortality experience of more than 500 wells that have been abandoned by reason of the practical exhaustion of their respective reservoirs. The essential facts that may be developed from a detailed study of these data have been reduced to condensed tabulations and graphic charts.

The basic historical data consist of the following tabulations:

Producing Wells—Classified by Fields, Company Owned and Other Owned Wells—531 Wells:

1. Meter Number.
2. Owner.
3. Farm Name.
4. Date Connected.
5. Years and Months in Service to Date.
6. Total Delivery to Date.
7. Original Rock Pressure.
8. Original Open Flow.
9. Present Rock Pressure.
10. Present Open Flow.

Abandoned Wells—Classified by Fields, Company Owned and Other Owned Wells—512 Wells:

1. Meter Number.
2. Owner.
3. Farm Name.
4. Date Connected.
5. Date Abandoned.
6. Years and Months in Service.
7. Total Delivery.

For reasons heretofore discussed, wells drilled in the Petrolia Field were eliminated from the studies.

[fol. 9486] From these basic historical data the following tabulations have been prepared and included in the report.

1. Table of Mortality Data 512 Abandoned Gas Wells, Texas and Oklahoma, Exclusive of Petrolia Field.

2. Condensed Mortality History of 512 Abandoned Gas Wells That Have Been Connected to Lone Star Gas Company System, Exclusive of Petrolia Field.

3. Summary of Total Average Deliveries of Abandoned Gas Wells that have Served the System of Lone Star Gas Company—Purchased and Produced.

4. Tabulations Showing Total Deliveries of Abandoned Gas Wells That Have Served the System of Lone Star Gas Company—Purchased and Produced.

5. Tabulation Showing Weighted Age of Gas Wells Now Serving the System of Lone Star Gas Company—Exclusive of Petrolia Field.

6. Tabulation Showing Weighted Age of Abandoned Gas Wells Having Served Lone Star Gas Company, Exclusive of Petrolia Field, Assuming all Abandoned Wells Now in Service.

7. Tabulation Showing Weighted Age of All Wells Having Served or Now Serving the System of Lone Star Gas Company—Exclusive of Petrolia Field, Assuming all Wells now in Service.

8. Condensed Mortality History of 1001 Gas Wells Through One Complete Life Cycle, All Wells Connected Since 1918, Exclusive of Petrolia Field.

From the information developed in these tabulations, Mortality Curves have been prepared which indicate the mortality characteristics of abandoned wells and the mortality characteristics of all wells connected since 1913.

The following summary sets out the essential facts shown by each of the tabulations.

The table of mortality data of 512 abandoned gas wells and the condensed mortality history of these same wells clearly indicate the extremely high mortality experience of natural gas wells in Southern Oklahoma and North Central Texas. Of the 512 wells abandoned, 50.6 per cent were abandoned after a service life of twenty-one months or less

[fol. 9487] and 75.6 per cent were abandoned after a service life of forty-one months or less. This extremely high rate of mortality is not indicative of the average well performance for the reason that abandoned wells only have been considered in the study. It nevertheless gives an insight into general characteristics of gas wells drilled in this section of the Mid-Continent Area.

The tabulations showing the total deliveries from abandoned gas wells have been commented upon in a preceding section of the report. The relatively small deliveries from these wells is in conformity with the facts developed relative to the high mortality rate of the same wells. As shown by the tabulations, the weighted average delivery from the abandoned wells was only 165,126 cubic feet. If the average cost of these wells was $20,000, the average cost for gas well construction and equipment without consideration of fixed charges during the period of depletion was in excess of $.12 per M. cubic feet produced. It is interesting to compare this unit cost of production with the unit cost of $.0206 used as the basis for the calculation of reserve accruals in the preceding section of this report.

The tabulation which sets out the weighted age of the wells now serving Lone Star Gas Company (exclusive of the Petrolia Field) shows that the two oldest wells now in service have had a service life of thirteen years and that only eighteen wells out of 531 have been in service eleven years. The weighted age of all wells now in service is approximately four years.

The tabulation which sets out the weighted age of the abandoned wells, wherein it is assumed that each of these wells is still in service, is of extreme interest in that it de- [fol. 9488] velops the fact that if each of the wells that have been abandoned were still in service, the weighted age of this group would be only 8.87 years.

The tabulation which sets out the weighted age of all wells in service and abandoned is a composite study based upon the two preceding tabulations. In this tabulation it is also assumed that all wells which have been abandoned are still in service and under this assumption, the weighted age of the entire group, 1043 in number, is 6.38 years.

The tabulation which sets out the condensed mortality history of 1001 gas wells through one complete life cycle is the most important in the group for the reason that it affords

the basis for the preparation of a true mortality curve for gas wells in Southern Oklahoma and North Central Texas.

This tabulation shows the percentages of failure to date for the group of wells attached to the System of Lone Star Gas Compay during each year from 1919 to 1932, inclusive. The year 1919 was selected as the initial year for the reason that the percentage of mortality for wells attached prior to 1920 has been 100 per cent.

The mortality curve derived from the tabulation is shown in graphic form in Lone Star Gas Company Depreciation Analysis—Mortality Curves for Gas Wells. From the mortality curve a distribution curve of annual replacements of original wells has also been developed and from this basic distribution curve, the necessary calculations have been made giving effect to replacements of original wells and replacements of replacements over two complete life cycles. In the calculations it was assumed that the replacements of original wells would have the same mortality characteristics as those of the original group.

[fol. 9489] The following tabulation sets out the calculated annual rates of replacements for various service years for gas wells as developed from the distribution curve of replacements of original wells and replacements of replacements.

Service Years	Calculated Annual Replacement Rates
1	.00
2	5.25
3	7.03
4	8.72
5	10.85
6	12.97
7	16.09
8	17.09
9	16.28
10	15.68
11	14.99
12	15.39
13	16.40
14	16.53
15	15.41

Service Years	Calculated Annual Replacement Rates
16	14.93
17	15.22
18	15.44
19	15.61
20	15.71
21	15.69
22	15.60
23	15.54
24	15.53
25	15.55
26	15.58
27	15.58
28	15.55
29	15.55

The weighted age of the wells now in service, as previously shown, is approximately four years. The average annual replacement rate for the twenty-five year period following the fourth service year is 15.4 per cent.
